# Guidance for Industry Pharmacogenomic Data Submissions

## *DRAFT GUIDANCE*

**This guidance document is being distributed for comment purposes only.**

Comments and suggestions regarding this draft document should be submitted within 90 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit comments to the Division of Dockets Management (HFA-305), Food and Drug Administration, 5630 Fishers Lane, rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document contact (CDER) Lawrence Lesko 301-594-5690, (CBER) Raj Puri 301-827-0471, or (CDRH) Steve Gutman 301-594-3084.

## Guidance for Industry<sup>1</sup> Pharmacogenomic Data Submissions

This draft guidance, when finalized, will represent the Food and Drug Administration's (FDA's) current thinking on this topic. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. You can use an alternative approach if the approach satisfies the requirements of the applicable statutes and regulations. If you want to discuss an alternative approach, contact the FDA staff responsible for implementing this guidance. If you cannot identify the appropriate FDA staff, call the appropriate number listed on the title page of this guidance.

### I. INTRODUCTION

This guidance is intended to facilitate scientific progress in the field of pharmacogenomics and to facilitate the use of pharmacogenomic data in informing regulatory decisions. The guidance provides recommendations to sponsors holding investigational new drug applications (INDs), new drug applications (NDAs), and biologics license applications (BLAs) on (1) when to submit pharmacogenomic data to the Agency during the drug or biological drug product<sup>2</sup> development and review processes, (2) what formats may be used for submissions, and (3) how the data will be used in regulatory decision making.

For the purposes of this guidance, *pharmacogenomics* is defined as the use of a pharmacogenomic or pharmacogenetic test (see glossary for definitions) in conjunction with drug therapy. Pharmacogenomics does not include the use of genetic or genomic techniques for the purposes of biological product characterization or quality control (e.g., cell bank characterization, bioassays). The FDA plans to provide guidance on these uses at a future time. Pharmacogenomics also does not refer to data resulting from proteomic or metabolomic techniques. This document is not meant to provide guidance on pharmacoproteomics or multiplexed protein analyte based technologies.

---

<sup>1</sup> This guidance has been prepared by the Center for Drug Evaluation and Research (CDER) and the Center for Biologics Evaluation and Research (CBER) at the Food and Drug Administration.

<sup>2</sup> For the purposes of this guidance, the term *drug* or *drug product* includes human drug and biological drug products.

Paperwork Reduction Act Public Burden Statement: According to the Paperwork Reduction Act of 1995, a collection of information should display a valid OMB control number. The valid OMB control number for this information collection is 0910-xxxx (expires x/xx/xx). The time required to complete this information collection is estimated to average 10 hours per response, including the time to review instructions, search existing data resources, gather the data needed and complete and review the information collection.

## ***Contains Nonbinding Recommendations***

*Draft— Not for Implementation*

35 FDA's guidance documents, including this guidance, do not establish legally enforceable  
36 responsibilities. Instead, guidances describe the Agency's current thinking on a topic and should  
37 be viewed only as recommendations, unless specific regulatory or statutory requirements are  
38 cited. The use of the word *should* in Agency guidances means that something is suggested or  
39 recommended, but not required.

### **41 II. BACKGROUND**

42  
43 The promise of pharmacogenomics lies in its potential ability to identify sources of inter-  
44 individual variability in drug response (both efficacy and toxicity); this will help individualize  
45 therapy with the intent of maximizing effectiveness and minimizing risk. However, the field of  
46 pharmacogenomics is currently in early developmental stages, and such promise has not yet been  
47 realized. Pharmaceutical sponsors have been reluctant to embark on programs of  
48 pharmacogenomic testing during the FDA-regulated phases of drug development because of  
49 uncertainties in how the data will be used by the FDA in the drug application review process.  
50 This guidance is intended to help clarify FDA policy in this area.

51  
52 Sponsors submitting or holding INDs, NDAs, or BLAs are subject to FDA requirements for  
53 submitting to the Agency data relevant to drug safety and efficacy (21 CFR 312.22, 312.23,  
54 312.31, 312.33, 314.50, 314.81, 601.2, and 601.12). Because these regulations were developed  
55 before the advent of widespread animal or human genetic or gene expression testing, they do not  
56 specifically address when such data should be submitted. The FDA has received numerous  
57 inquiries about what these regulations require of sponsors who are conducting such testing.

58  
59 From a public policy perspective, a number of factors should be considered when interpreting  
60 how these regulations should apply to the developing field of pharmacogenomics.

61  
62 Because the field of pharmacogenomics is relatively new, most experimental results may not be  
63 well enough established to be suitable for regulatory decision making. For example:

- 64
- 65 • Laboratory techniques and test procedures may not be well validated. In addition, test  
66 systems may vary so that results may not be consistent or generalizable across different  
67 platforms. A move to standardize assays is underway, and much more information should be  
68 available within the next several years.
  - 69
  - 70 • The scientific framework for interpreting the physiologic, toxicologic, pharmacologic, or  
71 clinical significance of certain experimental results may not be in place.
  - 72
  - 73 • The findings from a specific study often cannot be extrapolated across species or to different  
74 study populations (e.g., various human subpopulations with different genetic backgrounds).
  - 75 • The transmission, data processing, and storage of the large amounts of highly dimensional  
76 data generated from microarray technology has not been well validated nor widely tested.

77

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

78 Despite these concerns, some pharmacogenetic tests — primarily those related to drug  
79 metabolism — have well-accepted mechanistic and clinical significance and are currently being  
80 integrated into drug development decision making and clinical practice.

81  
82 It is important for the FDA to have a role in the evaluation of pharmacogenomic tests, both to  
83 ensure that evolving FDA policies are based on the best science and to provide public confidence  
84 in the field. It is also important that FDA policy facilitate, not impede, the use of  
85 pharmacogenomic tests during drug development and, to the extent possible, encourage open and  
86 public sharing of data and information on pharmacogenomic test results.

87  
88 To this end, the Agency has undertaken a process for obtaining input on these issues from the  
89 scientific community and the public. On May 16 and 17, 2002, the Agency held a workshop,  
90 cosponsored by pharmaceutical industry groups, to identify key issues associated with the  
91 application of pharmacogenetics and pharmacogenomics to drug development. Subsequently,  
92 on April 8, 2003, a public presentation was made to the FDA Science Board. This presentation  
93 contained a proposal for developing guidance on submission of information on  
94 pharmacogenomic tests and a potential algorithm for deciding whether a submission of such data  
95 is needed. The Science Board endorsed moving forward with both of these proposals.

96  
97 The policies and processes outlined in this draft guidance are intended to take the above factors  
98 into account and to assist in advancing the field in a manner that will benefit both drug  
99 development programs and public health.

### **III. SUBMISSION POLICY**

#### **A. General Principles**

100  
101  
102  
103  
104  
105  
106 Pharmacogenomic data submission policies must be consistent with the relevant codified regulatory  
107 submission requirements for IND, NDA, and BLA submitters and holders. At present, however,  
108 many pharmacogenomic results are not well enough established scientifically to be appropriate for  
109 regulatory decision making. This guidance interprets FDA's regulations for IND, NDA, and BLA  
110 submissions, helping to clarify FDA's current thinking about when the regulations require  
111 pharmacogenomic data to be submitted and when the submission of such data is voluntary. In some  
112 cases, complete reports of pharmacogenomic studies should be submitted, while in others, an  
113 abbreviated report or synopsis may be submitted.<sup>3</sup> Because FDA regulations establish different  
114 requirements for INDs, unapproved NDAs and BLAs, and approved NDAs and BLAs, this guidance  
115 sets out different submission algorithms for each of these categories. This guidance also clarifies  
116 how the FDA currently intends to use such data in regulatory decision making, that is, when the data  
117 will be considered sufficiently reliable to serve as the basis for regulatory decision making, when it  
118 will be considered only supportive to a decision, and when the data will not be used in regulatory  
119 decision making.

120  

---

<sup>3</sup> For further information on when abbreviated study reports can be submitted in NDAs and BLAs, see the guidance for industry *Submission of Abbreviated Reports and Synopses in Support of Marketing Applications*, developed under section 118 of the Food and Drug Administration Modernization Act.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

121 This guidance also makes a distinction between pharmacogenomic tests that may be considered *valid*  
122 *biomarkers* appropriate for regulatory decision making, and other less well-developed tests.  
123 Although currently most pharmacogenomic measurements are not considered valid biomarkers,  
124 certain markers (e.g., for drug metabolism) are well established biomarkers with clear clinical  
125 significance. Undoubtedly, the distinction between what tests are appropriate for regulatory decision  
126 making and those that are not will change over time as the science evolves.

127  
128 For the purposes of this guidance, a pharmacogenomic test result may be considered a *valid*  
129 *biomarker* if (1) it is measured in an analytical test system with well established performance  
130 characteristics and (2) there is an established scientific framework or body of evidence that  
131 elucidates the physiologic, pharmacologic, toxicologic, or clinical significance of the test results.  
132 For example, the consequences for drug metabolism of genetic variation in the human enzymes  
133 CYP450 2D6 and thiopurine methyltransferase are well understood in the scientific community  
134 and are reflected in certain approved drug labels. The results of genetic tests that distinguish  
135 allelic variants of these enzymes are considered valid biomarkers. The guidance makes an  
136 additional distinction between known valid biomarkers that have been accepted in the broad  
137 scientific community and probable valid biomarkers that appear to have predictive value for  
138 clinical outcomes, but may not yet be widely accepted or have been independently replicated  
139 (see Glossary). When a sponsor generates, or possesses, data sufficient to establish a significant  
140 association between a pharmacogenomic test result and clinical outcomes, the test result  
141 represents a probable valid biomarker. The algorithms described below for IND, NDA, and BLA  
142 holders describe when to submit to FDA data on known valid biomarkers. Data on probable  
143 valid biomarkers need not be submitted to the IND if they are not used by the sponsor in decision  
144 making. However, we recommend that sponsors or applicants submit reports on probable valid  
145 biomarkers to unapproved NDAs or BLAs according to the algorithm in section IV.B.

146  
147 Many pharmacogenomic testing programs currently carried out by pharmaceutical sponsors or  
148 by scientific organizations are intended to develop the knowledge base necessary to establish the  
149 validity of new genomic biomarkers. During such a period of scientific exploration, test results  
150 are not useful in making regulatory judgments pertaining to the safety or effectiveness of a drug  
151 and are not considered known or probable valid biomarkers. However, scientific development of  
152 this sort is highly desirable for advancing understanding of relationships between genotype or  
153 gene expression and responses to drugs and, therefore, should be encouraged and facilitated. For  
154 these reasons, although submission of exploratory pharmacogenomic data is not required under  
155 the regulations, the FDA is encouraging *voluntary submission* of such data, as described below.

### **B. Specific Uses of Pharmacogenomic Data in Drug Development and Labeling**

156  
157  
158  
159 As the field of pharmacogenomics advances, it is likely (and desirable) that sponsors will begin  
160 to use pharmacogenomic tests to support drug development and/or to guide therapy. Sponsors  
161 may choose to submit pharmacogenomic data that have not achieved the status of a valid  
162 biomarker to an IND, NDA, or BLA to support scientific contentions related to dosing, safety, or  
163 efficacy. For example, a sponsor may wish to provide supportive data demonstrating that  
164 changes in drug-induced gene expression differ between species that have different toxicologic  
165 responses to a drug, thus correlating changes in certain gene expression patterns with a specific

## *Contains Nonbinding Recommendations*

*Draft — Not for Implementation*

166 toxicity. A pharmacogenomic test result also might be used to stratify patients in a clinical trial  
167 or to identify patients at higher risk for an adverse event.

168

169 When pharmacogenomic results are to be used in decision making in an animal safety trial, or  
170 during clinical development in a human trial as part of the protocol, the submission algorithms  
171 described below suggest that full information on the test system should be submitted to the IND.  
172 In contrast, results from earlier feasibility studies done under the same IND (or outside the IND)  
173 to establish the potential usefulness of the pharmacogenomic test (e.g., from samples taken  
174 during a dose-response study) should not normally be submitted unless they provide support for  
175 the use of the test in clinical decision making.<sup>4</sup>

176

177 If a pharmacogenomic test shows promise for enhancing the dose selection, safety, or  
178 effectiveness of a drug, a sponsor may wish to fully integrate pharmacogenomic data into the  
179 drug development program. This could occur in two ways:

180

181 1. The pharmacogenomic data are intended to be included in the drug label in an  
182 informational manner.

183

184 For example, such data might be used to describe the potential for dose adjustment by  
185 drug metabolism genotype or to mention the possibility of a side effect of greater severity  
186 or frequency in individuals of a certain genotype or gene expression profile. In such  
187 cases, the pharmacogenomic test result may or may not be considered a valid biomarker,  
188 and an FDA-approved or widely used commercial pharmacogenomic test may not be  
189 available. Given this level of complexity, at the current time, sponsors should consult the  
190 relevant FDA review division for advice on how to proceed in a specific case. However,  
191 in all such cases, when a sponsor intends to include pharmacogenomic data in the drug  
192 label, we expect that complete information on the test and results would be submitted to  
193 the Agency as envisioned under §§ 314.50 and 601.2.

194

195 2. Dose selection, safety, or efficacy of a drug as described in its label will be contingent  
196 upon the performance of a pharmacogenomic test or tests. For example:

197

- 198 • In the later phases of clinical drug development, patients will be tested for drug  
199 metabolism genotype and dosed according to the test results.
- 200 • Patients will be selected for efficacy trial entry based on genotype (of patient or  
201 tumor) or gene expression profile.
- 202 • Patients will be excluded from the trial based on genotype or gene expression profile  
203 (e.g., marker for adverse event).

204 In all of these cases, the FDA recommends co-development of the pharmacogenomic  
205 tests and the drug and submission of complete information on the test to the Agency (in  
206 many cases, data on the test itself may be submitted to an IDE). The FDA plans to issue

---

<sup>4</sup> However, we recommend that a plan to perform any invasive test including phlebotomy, with the possible intent to conduct pharmacogenomic testing on a sample, be noted both in the protocol and the informed consent document.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

207 further guidance on co-development of pharmacogenomic tests and drugs in the near  
208 future.

209

210 If a new pharmacogenomic test will be used in therapeutic decision making (choosing or dosing  
211 of drugs), we recommend that sponsors consider obtaining premarket review by the Center for  
212 Devices and Radiological Health (CDRH) in conjunction with their drug development program.  
213 By studying or considering diagnostic issues in conjunction with the introduction of new drugs,  
214 or changes to existing therapeutic claims, it is often possible to provide simpler and more  
215 consolidated studies.

216

217 The Office of In Vitro Diagnostics in CDRH is willing to meet with sponsors to discuss both  
218 scientific and regulatory issues with regard to new pharmacogenomic diagnostics and has both  
219 formal (IDE) and informal (pre-IDE) processes for helping to evaluate protocols.

220

### **C. Voluntary Submission of Exploratory Pharmacogenomic Research Data**

222

223 At the current time, most pharmacogenomic data are of an *exploratory* or *research* nature, and  
224 FDA regulations do not require that these data be submitted to an IND, or that complete reports  
225 be submitted to an NDA or BLA. However, to be prepared to appropriately evaluate the  
226 anticipated future submissions, FDA scientists need to develop an understanding of relevant  
227 scientific issues, such as the following.

228

- 229 • The types of genetic loci or gene expression profiles being explored by the  
230 pharmaceutical industry for pharmacogenomic testing
- 231 • The test systems and techniques being employed
- 232 • The problems encountered in applying pharmacogenomic tests to drug development
- 233 • The ability to transmit, store, and process large amounts of complex pharmacogenomic  
234 data streams with retention of fidelity

235

236 Therefore, the FDA is requesting that sponsors conducting such programs consider providing  
237 pharmacogenomic data to the Agency voluntarily, when such data are not otherwise required  
238 under IND and NDA or BLA regulations. *Voluntary Genomic Data Submissions* (VGDSs) can  
239 be used for the submission of pharmacogenomic studies that are not required to be submitted.  
240 The FDA will establish a cross-center Interdisciplinary Pharmacogenomic Review Group (IPRG)  
241 to review VGDSs, to work on ongoing policy development, and to advise review divisions  
242 dealing with pharmacogenomic data.

243

244

## **IV. SUBMISSION OF PHARMACOGENOMIC DATA**

246

247 FDA regulations establish different requirements for INDs, unapproved NDAs and BLAs, and  
248 approved NDAs and BLAs. For this reason, there are different submission algorithms for the  
249 submission of pharmacogenomic data.

250

***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

251           **A.       Submission of Pharmacogenomic Data During the IND Phase**

252

253       Section 312.23 outlines information submission requirements for an IND, including for data  
254       generated or available during the IND phase. Section 312.23(a)(8) lays out the requirements for  
255       pharmacology and toxicology information: “Adequate information about pharmacologic and  
256       toxicological studies of the drug involving laboratory animals or in vitro, *on the basis of which*  
257       the sponsor has concluded that it is reasonably safe to conduct the proposed clinical  
258       investigations” (emphasis added). The in vitro and animal studies needed to establish a basis for  
259       proceeding with human trials of various types are well established internationally. Therefore,  
260       pharmacogenomic data relevant to, or derived from, animal or in vitro studies should ordinarily  
261       be submitted under § 312.23(a)(8) when the sponsor wishes to use these data to make a scientific  
262       case, or when the test is well established as a predictive biomarker (i.e., is a known valid  
263       biomarker).

264

265       Section 312.23(a)(9) sets forth the requirements for submission of previous human experience  
266       with the investigational drug. A summary is required on trials or human experience relevant to  
267       an evaluation of the safety or effectiveness of the drug. Therefore, sponsors must submit human  
268       data of known relevance (e.g., known valid pharmacogenomic biomarkers). In addition,  
269       sponsors or applicants must submit “any other information that would aid evaluation of the  
270       proposed clinical investigations with respect to their safety or their design and potential as  
271       controlled clinical trials to support the marketing of the drug” (312.23(a)(10)(iv)) and “if  
272       requested by the FDA, any other relevant information needed for review of the application”  
273       (312.23 (a)(11)). Human pharmacogenomic data intended to be used in decision making in the  
274       drug development process is such data. In cases when the validity of the test is not well  
275       established, such data will be viewed by the FDA as supportive only for the purposes of  
276       regulatory decision making.

277

278       Sponsors holding INDs who generate or possess pharmacogenomic data related to an  
279       investigational drug can comply with FDA requirements using the following algorithm:

280

281           *Pharmacogenomic data must be submitted to the IND under § 312.23 if ANY of the*  
282           *following apply:*

283

- 284           1. The test results will be used for decision making in any clinical trial, or in an animal  
285           trial used to support safety. (For example, the results will affect dose selection, entry  
286           criteria, safety monitoring, or subject stratification.)
- 287           2. The sponsor is using the test results to support scientific arguments pertaining to, for  
288           example, the safety, effectiveness, dosing and pharmacology of the drug.
- 289           3. The test results constitute a known valid biomarker for physiologic, pathophysiologic,  
290           pharmacologic, toxicologic, or clinical states or outcomes in humans, or is a known  
291           valid biomarker for a safety outcome in animal studies. If the information on the  
292           biomarker (example, human P450 2D6 status) is *not* being used for purposes 1 or 2  
293           above, the information can be submitted to the IND as an abbreviated report.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

294  
295  
296  
297

***Submission to an IND is NOT needed, but voluntary submission is encouraged (i.e., information does not meet the criteria of § 312.23) if***

298  
299  
300

4. Information is from exploratory studies or is research data, such as from general gene expression analyses in cells/animals/humans, or single-nucleotide polymorphism (SNP) analysis of trial participants.

301  
302

5. Information consists of results from test systems where the validity of the biomarker is not established.

303  
304  
305  
306

Although submission of such data in cases 4 and 5 is not required under the regulations, the FDA would welcome voluntary submission of the data in a VGDS. See Appendix A for additional guidance on assessing whether to submit pharmacogenomic data to an IND.

307  
308  
309

***Note:*** Regardless of requirements for submission, the fact that samples will be collected for potential analysis must be noted in any clinical protocol (312.23(a)(6)) and informed consent documents (50.25).

310

311  
312  
313  
314

Data from a VGDS submission to an IND will not be used for regulatory decision making. However, after the sponsor submits a VGDS, if additional information becomes available that renders the results required to be submitted under §§ 312, 314, or 601, the sponsor must submit the data to the IND, NDA, or BLA, respectively, and should follow the appropriate algorithm.

315

316  
317

### **B. Submission of Pharmacogenomic Data to a New NDA, BLA, or Supplement**

318  
319  
320  
321  
322  
323  
324  
325  
326  
327

Section 314.50 outlines the NDA submission requirements; section 601.2 generally outlines BLA submission requirements. As the introduction to § 314.50 states, “the [NDA] application is required to contain reports of all investigations of the drug product sponsored by the applicant, and all other information about the drug product pertinent to an evaluation of the application that is received or otherwise obtained by the applicant from any source.” Therefore, to comply with these regulations, sponsors will need to provide reports of pharmacogenomic investigations in their NDAs, and to permit a thorough analysis of a biologics application, a sponsor would want to submit such a report in its BLA. However, the extent and format of such reports will depend on the relevance and application of the information.

328  
329  
330  
331

Subsequent paragraphs of § 314.50 outline the submission requirements in specific disciplines. Nonclinical pharmacology and toxicology filing requirements are described in § 314.50(d)(2); human pharmacokinetics and bioavailability requirements in § 314.50(d)(3); and clinical data requirements in § 314.50(d)(5).

332  
333  
334  
335  
336  
337  
338

Section 601.2 outlines the BLA submission requirements. Section 601.2 states that the BLA manufacturer shall submit data derived from nonclinical laboratory and clinical studies that demonstrate that the manufactured product meets prescribed requirements of safety, purity, and potency. Like NDA sponsors, BLA sponsors should provide reports of pharmacogenomic investigations in their BLAs. However, the extent and format of such reports will depend on the relevance and application of the information.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

339

340 Sponsors who have generated or possess pharmacogenomic data related to a drug can comply  
341 with the regulations' requirements using the algorithm below.

342

343

344

345

346

347

348

349

1. Provide reports on pharmacogenomic investigations intended by the sponsor to be used in the drug label or as part of the scientific database being used to support approval as complete submissions (not in the form of an abbreviated report, synopsis, or VGDS), including information about test procedures and complete data, in the relevant sections of the NDA or BLA. If the pharmacogenomic test is already approved by the FDA or is the subject of an application filed with the Agency, information on the test itself can be provided by cross reference.

350

The following examples would fit this category.

351

352

353

354

355

- Pharmacogenomic test results that are being used to support scientific arguments made by the sponsor about drug dosing, safety, patient selection, or effectiveness
- Pharmacogenomic test results that the sponsor proposes to describe in the drug label
- Pharmacogenomic tests that are essential to achieving the dosing, safety, or effectiveness described in the drug label

356

357

358

359

360

361

362

2. Submit reports of pharmacogenomic test results that constitute known valid biomarkers for physiologic, pathophysiologic, pharmacologic, toxicologic, or clinical states or outcomes in the relevant species, but that the sponsor is not relying on or mentioning in the label, to the Agency as an abbreviated report (not in the form of a synopsis or VGDS). (If a pharmacogenomic test of this type was conducted as part of a larger overall study, the reporting of the pharmacogenomic test results can be incorporated into the larger study report.)

363

364

365

366

367

3. Submit reports of pharmacogenomic tests that represent probable valid biomarkers for physiologic, pathophysiologic, pharmacologic, toxicologic, or clinical states or outcomes in the relevant species to the NDA or BLA as an abbreviated report. (If the pharmacogenomic testing of this type was conducted as part of a larger study, the abbreviated report can be appended to the report of the overall study.)

368

369

370

371

372

373

374

375

4. There is no need to submit detailed reports of general exploratory or research information, such as broad gene expression screening, collection of sera or tissue samples, or results of pharmacogenomic tests that are not known or probable valid biomarkers to the NDA or BLA. Because the Agency does not view these studies as germane in determining the safety or effectiveness of a drug, the submission requirements in §§ 314.50 or 601.2 will be satisfied by the submission of a synopsis of the study. However, the Agency encourages the voluntary submission of the data from the study in a VGDS submitted to the NDA or BLA.

376

377

378

379

380

381

See Appendix B for additional guidance on how to assess whether to submit pharmacogenomic data to an unapproved NDA or BLA.

### **C. Submission to an Approved NDA or BLA**

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

382 The requirements for submitting new scientific information to an approved NDA or BLA are  
383 outlined in §§ 314.81(b)(2) and 601.12. Results of nonclinical or clinical pharmacogenomic  
384 investigations on known or probable valid biomarkers must be submitted in the annual report as  
385 synopses or abbreviated reports (21 CFR 314.81(b)(2)).  
386

387 Pharmacogenomic study results of other types do not meet the submission requirements outlined  
388 in the regulations (§ 314.81(b)(2)). However, such reports can be voluntarily submitted to the  
389 NDA or BLA as a VGDS.  
390

### **D. Compliance with 21 CFR Part 58**

392  
393 Questions have been raised about the need for pharmacogenomic studies to comply with the  
394 requirements of 21 CFR part 58, which describes good laboratory practices (GLPs) for  
395 nonclinical laboratory studies that support INDs and NDAs. Section 58.3(d) (21 CFR 58.3(d))  
396 defines *nonclinical laboratory studies* as “in vivo or in vitro experiments in which test articles  
397 are studied prospectively in test systems under laboratory conditions to determine their safety.  
398 The term does not include studies utilizing human subjects or clinical studies or field trials in  
399 animals. The term does not include basic exploratory studies carried out to determine whether a  
400 test article has any potential utility....”  
401

402 The requirements of part 58 apply to nonclinical studies submitted to support safety findings,  
403 including nonclinical pharmacogenomic studies intended to support regulatory decision making.  
404 Any studies eligible to be submitted in an abbreviated report, synopsis or VGDS under the  
405 algorithms discussed above do not fall under part 58.  
406  
407

### **V. FORMAT AND CONTENT OF A VGDS**

409  
410 This section provides recommendations on the format and content of VGDS reports and data.  
411 The FDA invites submission of exploratory pharmacogenomic data on drugs or candidate drugs  
412 whether or not the drugs are currently the subject of an active IND, NDA, or BLA. Exploratory  
413 genomic data may result from, for example, DNA microarray gene expression profiling  
414 experiments, expression biomarkers from single or limited gene expression profiles, genotyping  
415 or single-nucleotide polymorphism (SNP) profiling of clinical study participants, or from other  
416 studies using evolving methodologies that are intended to facilitate global analysis of gene  
417 structure or gene function.  
418

419 The purpose of the VGDS process is to provide the FDA access to emerging pharmacogenomic  
420 data so that a foundation can be built for developing scientifically sound regulatory policies. The  
421 Agency intends to gain experience and to develop an aggregate genomic knowledge database  
422 from multiple VGDSs that could be used to rationally facilitate the use of pharmacogenomics in  
423 drug development and to share what general knowledge is learned from the data repositories,  
424 where appropriate. The VGDS process will also provide a forum for scientific discussion of  
425 exploratory data within the FDA outside of the application review process.  
426

## *Contains Nonbinding Recommendations*

*Draft — Not for Implementation*

427 Currently, consensus standards do not exist for presenting and exchanging genomic data,  
428 although such standards are evolving. Therefore, this guidance does not recommend a specific  
429 format for the VGDS. We recommend only that, to achieve the goals of the VGDS process, the  
430 data submitted in a VGDS and the level of detail be sufficient for the Agency to interpret the  
431 information and independently analyze the data, verify results, and explore possible genotype-  
432 phenotype correlations across studies. We do not, however, want submission of a VGDS to be  
433 overly burdensome and time-consuming for sponsors. Therefore, we offer the following  
434 examples of possible VGDS formats:

435

- 436 • An article submitted to a peer-reviewed scientific journal
- 437 • An evolving public standard for specific types of experiments, such as the Minimum Information  
438 About a Microarray Experiment (MIAME) standard for microarray expression data.<sup>5</sup> An  
439 analogous approach could be used for formatting a VGDS containing genotyping or other  
440 genomic data derived from technology platforms other than nucleic acid hybridization arrays.

- 441 • A report on a gene expression microarray experiment containing the following:

442 Title page

443 Background and scientific rationale

444 Primary and secondary study goals

445 Synopses and summary of findings

446 Study design and sample collection

447 Array design and description

448 Quality control tests performed on arrays

449 Sample processing and preparation

450 Demonstration of quality of RNA or DNA

451 Hybridization procedures and parameters

452 Measures of performance of hybridization such as spike-in control

453 Measurements and quantification

454 Normalization controls

455 Number of repeats (array hybridized), number of biological assays performed

456 Statistical analysis

457 Bioinformatics tools and software used. Source of gene annotation

458 Validation of gene expression by conventional assays such as Northern blot, real time

459 PCR (polymerase chain reaction), RT-PCR (reverse transcriptase-PCR),

460 immunohistochemistry, or Western blot, if reagents available

461 Validation of SNP by SSCP (single-strand conformation polymorphism) or other assays

462 Submission of electronic file containing raw images, raw data, scatter plots for all

463 experiments reaching the conclusion, as well as an electronic data file of the

464 background-corrected gene expression data (spot intensities) from microarray

465 experiments that were used for analysis

466 Results and conclusions

467 References

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

469 The Agency will develop more specific guidance on how to submit detailed reports of genomic  
470 research data to INDs, NDAs, and BLAs.

471

472

### 473 **VI. PROCESS FOR SUBMITTING PHARMACOGENOMIC DATA**

474

475 Depending on the type of pharmacogenomic data, sponsors should submit reports according to  
476 the following recommendations.

477

478 • Complete reports, abbreviated reports, or synopses of pharmacogenomic studies to INDs,  
479 NDAs, or BLAs should be submitted in the usual manner.

480

481 • Sponsors who wish to voluntarily submit pharmacogenomic data to the FDA should  
482 submit the report to the relevant IND, NDA, or BLA, clearly labeled as a Voluntary  
483 Genomic Data Submission (VGDS), or as a pre-IND submission in the case of candidate  
484 drugs.

485

486

### 487 **VII. FDA REVIEW OF PHARMACOGENOMIC DATA**

488

489 The FDA has received many questions about the use of pharmacogenomic data in the application  
490 review process. Many questions reflect the concern that the Agency will raise new questions and  
491 require additional data based on findings from exploratory pharmacogenomic studies, that new  
492 studies will be required or suggested based on preliminary human pharmacogenomic data, that  
493 indicated populations will be narrowed or restricted based on the pharmacogenomic results in  
494 subpopulations, or that new studies in subpopulations will be required after retrospective analysis  
495 suggests differential responses based on pharmacogenomic subgrouping. There is also concern  
496 about the availability of staff who are expert in interpretation of such data.

497

498 *The FDA will not use information submitted through the voluntary process for regulatory*  
499 *decision making on INDs or NDAs.* VGDS filings will be analyzed by the Interdisciplinary  
500 Pharmacogenomic Review Group (IPRG) and the relevant review division staff. This process is  
501 intended to ensure that scientific staff experienced in the evaluation of such studies participate in  
502 analysis of the data. Any data evaluation will be for scientific and informational purposes.  
503 However, after the sponsor submits a VGDS, if additional information becomes available that  
504 renders the results required to be submitted under §§ 312, 314, or 601, the sponsor must submit  
505 the data to the IND, NDA, or BLA, respectively, and should follow the appropriate algorithm. If  
506 the FDA becomes aware of the significance of a particular PG test after evaluating results across  
507 sponsors, the Agency will notify sponsors about this determination. A review division also may  
508 consult the IPRG when pharmacogenomic data are part of a required submission to an IND,  
509 NDA, or BLA as a complete report, abbreviated report, or synopsis.

510

511 The animal and in vitro toxicology database needed to support human trials at various stages of  
512 the IND process and to support marketing of short- or long-term use drugs is well established.  
513 Any proposals for the substitution or addition of new animal safety tests will ordinarily be the

## *Contains Nonbinding Recommendations*

*Draft— Not for Implementation*

514 product of a public process involving the international scientific and drug development  
515 community.

516

517 Currently, as discussed above, only a few pharmacogenetic tests for certain drug metabolizing  
518 enzymes are considered valid biomarkers in humans. Considerable concern has been expressed  
519 about how the FDA will evaluate newer types of pharmacogenomic data (e.g., results that may  
520 predict increased risk of adverse events, or point to an enhanced probability of response). In fact,  
521 the FDA has considerable experience dealing with these issues in other contexts. Examples of  
522 how pharmacogenomic studies fit into this experience include the following.

523

524 • Descriptions of drug metabolizing phenotypes and discussion of their impacts on dosing  
525 are common in drug labels. Extrapolation of this information to pharmacogenetic testing  
526 is straightforward.

527

528 • There are many conditions or co-factors that may increase an individual's susceptibility  
529 to an adverse event (e.g., co-morbid conditions, metabolic susceptibilities such as renal or  
hepatic failure, or interacting drugs).

530

531 FDA's usual approach in such cases has been to request that information be added to the drug  
532 label that describes the possible interaction and advises on precautions. Were a sponsor to  
533 discover a new pharmacogenomic test that could possibly distinguish patients at greater risk for a  
534 serious adverse event, it is likely that both the sponsor and the Agency would have great interest  
535 in exploring the correlation in the appropriate populations. However, if the sponsor also moved  
536 forward on developing the drug in the overall indicated population, the FDA would evaluate the  
537 safety database on its merits. If the sponsor decided to develop the drug solely in populations  
538 from which certain patients were excluded based on pharmacogenomic testing, the FDA would  
539 recommend co-development of the pharmacogenomic test (as a diagnostic) and the drug because  
540 the FDA would be unable to approve a drug for which the safety profile was predicated on a  
541 pharmacogenomic test that was unavailable.

541

542 It is most likely that, in the near future, pharmacogenomic markers that predict drug toxicity will  
543 be identified and developed on a parallel path with overall drug development. In other words,  
544 the drug would be developed in a conventional manner with a parallel effort to identify  
545 appropriate predictors of toxicity. If the drug's risk-benefit profile were acceptable, the drug  
546 could be approved prior to the completion of efforts to refine and develop the relevant  
547 pharmacogenomic tests. When and if a test's predictive value were to be established and the test  
548 were to become commercially available (either as an approved device or as a service), the drug  
549 label could be changed to reflect the data.

550

551 • The FDA has similar experience with tests used to target populations likely to respond to  
552 therapy.

553

554 Several decades ago, broad indications for use were described in labels. Over time, as more  
555 exact diagnoses were developed, narrower indications were sought by sponsors, based on the  
556 clinical trials conducted. A similar evolution occurred in the field of anti-HIV therapies as drug  
557 resistance testing became available. We encourage sponsors to continue to develop  
558 pharmacogenomic tests that are predictive of subpopulations with enhanced response to therapy.

***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

559 However, if overall drug development is pursued in the larger population, the effectiveness and  
560 risk-benefit will be evaluated in that population, and approval decisions will be based on the  
561 overall database.

562

563 Much of the concern about FDA actions in this area is based on the perception that  
564 pharmacogenomic testing is likely to give very definitive answers about safety and effectiveness  
565 in subpopulations. This may happen sometimes (e.g., in oncology) and in such cases, rapid  
566 development of a diagnostic test is highly encouraged. However, this is unlikely to be the  
567 ordinary case. In most instances, genotype or gene expression profile is likely to be one of a  
568 number of factors, so that probability of an adverse event or a favorable response would be  
569 increased, but the outcome not inevitable. For this reason, genetic markers can ordinarily be  
570 handled like other predictive markers in the clinical arena.

571

612

The following definitions are for use in the processes outlined in this guidance, and are not intended to be broadly applicable to the entire field.

**Biological marker (biomarker):** A characteristic that is objectively measured and evaluated as an indicator of normal biologic processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention<sup>6</sup>

**Pharmacogenetic test:** An assay intended to study interindividual variations in DNA sequence related to drug absorption and disposition (pharmacokinetics) or drug action (pharmacodynamics) including polymorphic variation in the genes that encode the functions of transporters, metabolizing enzymes, receptors and other proteins

**Pharmacogenomic test:** An assay intended to study interindividual variations in whole-genome or candidate gene single-nucleotide polymorphism (SNP) maps, haplotype markers, and alterations in gene expression or inactivation that may be correlated with pharmacological function and therapeutic response

**Valid biomarker:** A biomarker that is measured in an analytical test system with well-established performance characteristics and for which there is an established scientific framework or body of evidence that elucidates the physiologic, toxicologic, pharmacologic, or clinical significance of the test results

- **Known valid biomarker:** A biomarker that is measured in an analytical test system with well-established performance characteristics and for which there is widespread agreement in the medical or scientific community about the physiologic, toxicologic, pharmacologic, or clinical significance of the results
  
- **Probable valid biomarker:** A biomarker that is measured in an analytical test system with well-established performance characteristics and for which there is a scientific framework or body of evidence that appears to elucidate the physiologic, toxicologic, pharmacologic, or clinical significance of the test results. A probable valid biomarker may not have reached the status of a known valid marker because, for example,
  - The data elucidating its significance may have been generated within a single company and may not be available for public scientific scrutiny.
  - The data elucidating its significance, although highly suggestive, may not be conclusive.
  - Independent replication of the results may not have occurred.

APPENDIX A: SUBMISSION OF PHARMACOGENOMIC (PG) DATA TO AN IND

Reports of pharmacogenomic investigations should be submitted to the NDA in the following formats:

*Pharmacogenomic data must be submitted to the IND under § 312.23 if ANY of the following apply:*

1. The test results will be used for decision making in any clinical trial, or in an animal trial used to support safety. (For example, the results will affect dose selection, entry criteria, safety monitoring, or subject stratification.)
