

The *agedate* parameter on the DOB card provides a date upon which to calculate the age. If provided, it must be a numeric field.

13. ERROR13: The month of the age date on the DOB card is invalid: #
14. ERROR14: The day of the age date on the DOB card is invalid: #
15. ERROR15: An undefined field name was specified on the OUTREC card: *fieldname*  
The OUTREC card contains a field name that is undefined. It is not one of the predefined names, and it is not a user-defined field name. The field name in question is shown on the card.
16. WARNING16: Field specified at least twice on the OUTREC card: *fieldname*
17. ERROR17: Unidentifiable keyword on control card: *keyword*  
The control file contains a line that cannot be understood by ACGGROUP. Check the proper spelling of the keyword on the control card shown in the message.
18. WARNING18: An ID2 card was used, but no second input file was specified.  
*If no second input file is specified, then an ID2 card is not needed. One was specified that will be ignored.*
19. ERROR19: Duplicate, missing, or reserved user field name on FIELD card: #  
The field card specified by # contains a field name that is already defined, either as a predefined field or on another FIELD card, or it contains no field name.
20. ERROR20: Parameter 3 is not allowed on control card: #  
The control card specified by # contains something where a third parameter would be specified, but a third parameter is not allowed on this control card. In particular, if this is an ID card, note that previous versions would allow multiple, noncontiguous pieces of the ID to be defined on a single ID card, whereas this version of the software only allows one piece of the ID to be defined per ID card. Multiple ID cards can be used to define other parts of the ID. As an example, in previous versions, the card ID=1,10,20,5 would be acceptable. In this version, this input would generate the error message. The proper coding would be with two ID cards: ID=1,10 and ID=20,5.
