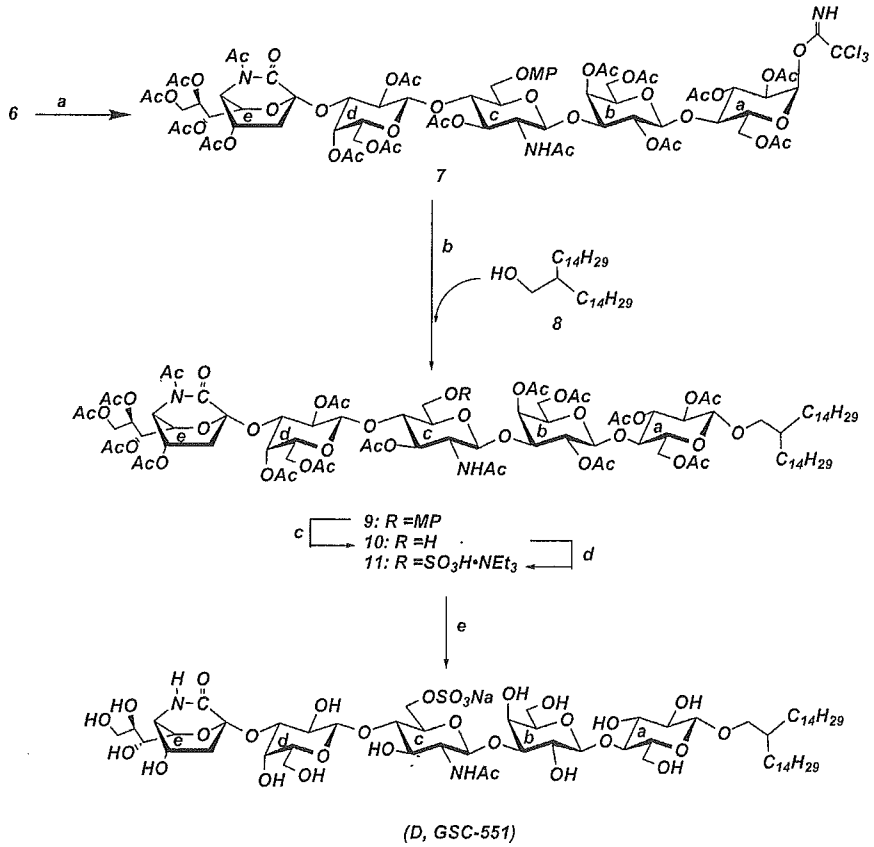
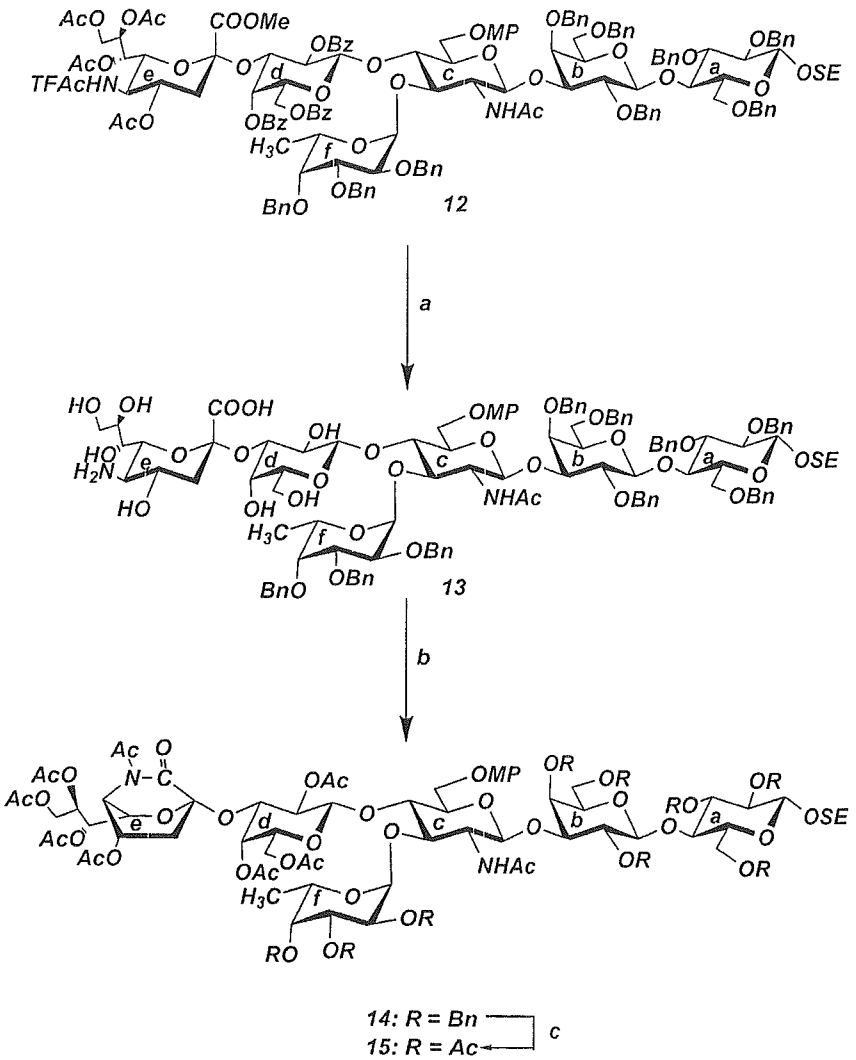
[a] δ (multiplicity, J(Hz)). Measured at 500 MHz in $CDCl_3$ or CD_3OD.



Scheme 2. (a) 1) TFA/CH_2Cl_2, 0°C, 93%, 2) CCl_3CN, DBU/CH_2Cl_2, 0°C, 83%; (b) TMSOTf/CH_2Cl_2, AW-300, 0°C, 43%; (c) CAN/CH_3CN/H_2O, 0°C, 73%; (d) SO_3· Pyr complex/DMF, then Et_3N, r.t., 89%; (e) NaOMe/MeOH, r.t., 92%.



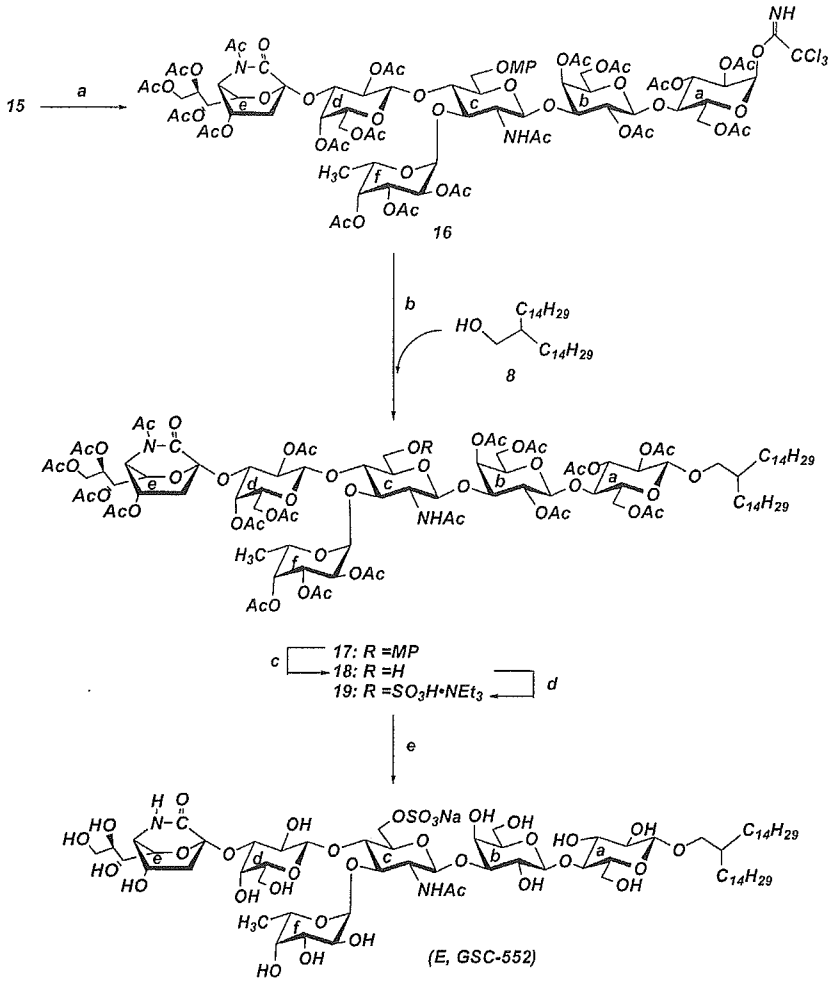
Scheme 3. (a) NaOMe, MeOh, then H_2O, 45°C, 85%; (b), 1, HBTU, HOBt, DMF, 65°C, 2, Ac_2O, Pyr., 70% (two steps); (c) 1, H_2, $Pd(OH)_2$, EtOH, 2, Ac_2O, Pyr., 90% (two steps).

2-(tetradecyl)hexadecanol **8** with **7** in the presence of TMSOTf and AW 300 gave the desired β-glycoside **9** (43%). Selective cleavage of the 4-methyoxyphenyl (MP) group in **9** and the subsequent 6-*O*-sulfation of **10** with the sulfur trioxide-pyridine complex in DMF, followed by an addition of triethylamine afforeded **11** in high yield. Removal of all protective groups in **11** under alkaline conditions furnished the target compound (**D**, **GSC-551**) in 92% yield (Scheme 2).

The conversion of **12** [12] into the lactam derivative **14** was accomplished by treatment of **13** with HBTU and HOBt in DMF for 3 h at 65°C and following complete acetylation (70% in 2 steps). The ^1H NMR spectrum of **14** showed signals at δ 2.37 (dd, 1H, $J_{3\alpha,4}$ 5.7, J_{gem} 13.8 Hz, H-3eα) and 2.30 (dd, 1H, $J_{3\beta,4}$ 10.1, J_{gem} 13.8 Hz, H-3eβ) characteristic of the $^{5,2}B$ boat conformation of sialic acid (Table 1).

Hydrogenolytic removal of the benzyl groups in **14** and the following complete acetylation gave **15** (90% in 2 steps) which was then converted to the trichloroacetimidate derivative **16** as described for **7**. The imidate **16** was coupled with **8**, and the resulting **17** was treated with ceric ammonium nitrate (CAN) in acetonitrile to give **18**, which was successively sulfated and stabilized by treatment with triethylamine. Complete deprotection of **19** under alkaline conditions and purification on a column of Sephadex LH-20 gave the desired lactamized-sialyl 6-*O*-sulfo Le^x neo-glycolipid (**E**, **GSC-552**) in high yield.

As shown in Figure 4, the synthesized compounds GSC-551 (**D**) and GSC-552 (**E**) were clearly stained with G159 mAb in TLC-immunostaining as well as GSC-535 (**B**) and GSC-550 (**C**). In contrast, GSC-517 (**A**) was not stained. These results suggest that the sulfate group at *O*-6 of GlcNAc could be essential for the recognition of G159 mAb, while the fucose residue not. The difference in the structures of the ceramide and the artificial ceramide (B30) may not be critical for the recognition with G159 mAb. In addition, the significance of the lactose moiety was also demonstrated. A further study to elucidate the details of the recognition mapping defined by G159 mAb is now under investigation.



Scheme 4. (a) 1) TFA/CH_2Cl_2, 0°C, 93%, 2) CCl_3CN, DBU/CH_2Cl_2, 0°C, 83%; (b) TMSOTf/CH_2Cl_2, AW-300, 0°C, 43%; (c) CAN/CH_3CN/H_2O, 0°C, 70.6%; (d) SO_3· Pyr complex/DMF, then Et_3N, r.t., 80%; (e) NaOMe/MeOH, r.t., quant.

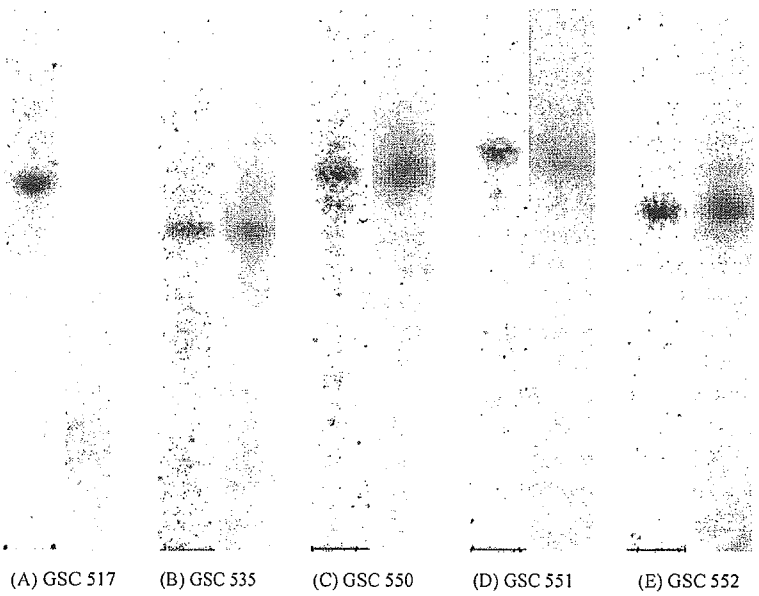


Figure 4. Reactivity of G159 mAB with four glycolipids. Each of left side plates show orcinol/H_2SO_4 staining which visualizes all glycolipids and right side plates show G159 immunostaining. All of them, except GSC-517, have been recognized with G159 mAb.

Conclusions

In summary, we have achieved the synthesis of novel glycolipids (GSC-551 and GSC-552) related to lactamized-sialyl 6-*O*-sulfo Lewis X ganglioside and sialylparagloboside. Utilizing the synthesized glycolipid probes, we demonstrated the recognition specificity of G159 mAb which was obtained during the course of study on the endogenous L-selectin ligand [11].

Taking it into consideration that modified sialic acids have also been found as the constituents of other sialoglycoconjugates [15–17], modification of sialic acids can be recognized as a general phenomenon.

Experimental section

General methods

TLC was conducted on E. Merck silica gel 60 F-254 aluminum plate. Compounds were visualized either by exposure to UV light or by spraying with a solution of 10% H_2SO_4 in ethanol. Column chromatography on silica gel (Fuji Silysia Co., 300 mesh) was performed with the solvent systems (*v/v*) specified. Specific rotations were determined with a Horiba SEPA-300 high-sensitive polarimeter at 25°C. ^{1}H NMR and ^{13}C NMR spectra were recorded at 300 K with a Varian Unity Inova 500 (500 MHz) or Varian Unity Inova 400 (100.6 MHz) spectrometer, respectively. The values of δ (ppm) are given relative to Me_4Si as the internal standard. Dichloromethane, methanol, ethanol, benzene and DMF were kept dry over 4 Å MS, while pyridine and acetonitrile were kept dry over 3 Å MS.

2-(Trimethylsilyl)ethyl (methyl 4,7,8,9-tetra-*O*-acetyl-3,5-dideoxy-5-trifluoroacetamido-D-*glycero*-α-D-*galacto*-2-nonulopyranosylonate)-(2→3)-(2,4,6-tri-*O*-benzoyl-β-D-galactopyranosyl)-(1→4)-(2-acetamido-3-*O*-benzyl-2-deoxy-6-*O*-4-methoxyphenyl-β-D-glucopyranosyl)-(1→3)-(2,4,6-tri-*O*-benzyl-β-D-galactopyranosyl)-(1→4)-2,3,6-tri-*O*-benzyl-β-D-glucopyranoside (3)

To a solution of **1** (703 mg, 0.63 mmol) and the trisaccharide acceptor **2** (650 mg, 0.47 mmol) in dry dichloromethane (5 mL) was added molecular sieves 4 Å (1.4 g), and the mixture was stirred for 5 h at room temperature, then cooled to 0°C. Trimethylsilyl trifluoromethanesulfonate (TMSOTf; 17 μL, 84.9 μmol) was added to the mixture and this was stirred for 24 h at 3°C, neutralized with Et_3N and filtered, and the residue was washed with chloroform. The combined filtrate and washings were concentrated. Column chromatography (100:1 $CHCl_3$-MeOH) of the residue on silica gel gave **3** (850 mg, 76%) as an amorphous mass; $[\alpha]_D^{24} = +14.5°$ (c = 1.0, $CHCl_3$); ^{1}H NMR($CDCl_3$): δ = 8.16–6.73 (m, 54 H, MeO*Ph*, 10 Ph), 6.26 (d, 1 H, br-d, NHe), 5.56 (m, 1 H, H-8e), 5.50 (dd, 1 H, $J_{1,2}$7.8, $J_{2,3}$ 10.1 Hz, H-2d), 5.39 (d, 1H, H-4d), 5.32 (d, 1 H, $J_{2,NH}$8.9 Hz, NHc), 5.22 (dd, 1 H, $J_{6,7}$ 2.3, $J_{7,8}$ 9.4 Hz, H-7e), 5.12 (d, 1 H, $J_{1,2}$ 7.8 Hz, H-1d), 4.93 (dd, 1 H, $J_{2,3}$ 10.1, $J_{3,4}$ 3.2 Hz, H-3d), 4.40 (d, 1 H, $J_{1,27,3}$ Hz, H-1c), 4.34 (d, 1 H, $J_{1,2}$ 8.0 Hz, H-1a), 3.86 (s, 3 H, COO*Me*), 3.71 (s, 3 H, *Me*OPh), 3.57 (m, 2 H, $Me_3SiCH_2CH_2$), 2.54 (dd, 1 H, $J_{3eq,4}$ 4.8, J_{gem}12.8 Hz, H-3e*eq*), 2.18, 1.97, 1.92, 1.47 (4 s, 12 H, 4 AcO), 1.67 (t, 1 H, $J_{gem} = J_{3ax,4}$ 12.8 Hz, H-3e*ax*), 1.46 (s, 3 H, AcN), 1.03 (m, 2 H, $Me_3SiCH_2CH_2$).

Abstract—A novel neo-glycolipid containing sialyl Lewis X determinant carried on the mucin GlcNAcβ1-6GalNAcα core structure has been designed and synthesized. By employing this compound as a probe, the structure required for the recognition of anti-cancer antibodies, NCC-ST-439, has been elucidated.

1. Introduction

Sialyl Lewis X, known as a ligand for selectins, is suggested to be involved in the hematogeneous metastasis of many cancer cells.[2,3] Sialyl Lewis X is carried by various internal carbohydrate structures, which generate a considerable heterogeneity in molecular species of sialyl Lewis X determinants at the surface of cells and tissues, each of which might have distinct physiological significance.

The antibody NCC-ST-439 was initially raised against human gastric cancer cells[4] and later shown to recognize a tumor-associated carbohydrate antigen in breast, gastric, and colon cancers. This suggested that the antigen recognized by NCC-ST-439 is closely related to sialyl Lewis X.

As part of our continuing studies on a chemical approach to carbohydrate antigens of cancers, we report herein the design and synthesis of a novel neo-glycolipid containing the sialyl Lewis X determinant carried on the mucin GlcNAcβ1-6GalNAcα core structure, (GSC-384) **16** and its reactivity against the NCC-ST-439 antibody in comparison with the conventional sialyl Lewis X determinants on straight (GSC-64) or branched (GSC-154) carbohydrate skeleton (Fig. 1).[5,6]

2. Results and discussion

The most significant problems in the synthesis of the title compound are: (i) α-stereoselective glycoside formation of the GalNAc residue with the lactose moiety as a spacer, (ii) efficient construction of the sialyl Lewis X on the mucin GlcNAcβ1-6GalNAcα core structure, and (iii) introduction of the lipid into the complex oligosaccharide.

The first problem was solved by employing a 2-azido derivative of galactose, which is equivalent to galactosamine. Trisaccharide **1** synthesized according to the procedure previously described,[7] was coupled with glucosamine donor **2**[8] in the presence of *N*-iodosuccinimide (NIS)-trifluoromethanesulfonic acid (TfOH)[9,10] at −15 °C, to give tetrasaccharide **3** (85%) which has the core 6 structure (Scheme 1).

For the construction of the sialyl Lewis X structure, we employed the strategy, which begins with the introduction of the sialylgalactose moiety to *O*-4 of GlcNAc and is followed by the fucosylation at *O*-3 of GlcNAc. Removal of the phthaloyl and acetyl groups of **3** with H_2N–NH_2·H_2O in ethanol, and the selective *N*-acetylation with acetic anhydride in methanol gave the

tetrasaccharide acceptor **4** (80%). Acceptor **4** was glycosylated with the freshly prepared sialyl-α (2→3)-galactose trichloroacetimidate donor **5**[11] in the presence of trimethylsilyl trifluoromethanesulfonate (TMSOTf), to give the desired hexasaccharide **6** (68%). The acid labile isopropylidene group at *O*-3 and 4 of GalNAc was replaced with an acetyl group before removal of the 4-methoxybenzyl (MPM) group in the GlcNAc residue. The hexasaccharide acceptor **9** was obtained in three steps: (i) removal of the isopropylidene group with aqueous 80% acetic acid (90%); (ii) acetylation with acetic anhydride/pyridine (quant.), and (iii) removal of the MPM group with ceric ammonium nitrate (93%).[12] This acceptor was fucosylated with donor **10**[13] and promoted by NIS-TfOH in benzene, to afford the desired heptasaccharide **11** in 80%. The stereochemistry of the newly formed glycosidic linkage was indicated to be α by the small coupling of the proton of H-1 ($J_{1,2}$ 3.4 Hz), which

is a characteristic feature for 1,2-*cis* fucopyranosides (Scheme 2).

The introduction of a lipid into the complex oligosaccharide, a third problem, was accomplished by the glycosydation reaction via 1,2-orthoester formation. Removal of the benzyl groups from **11** by catalytic hydrogenation over palladium hydroxide in ethanol, and subsequent acetylation gave the per-*O*-acylated heptasaccharide **12** (89%). Selective removal[14] of the 2-(trimethylsilyl)ethyl (SE) group from **12** (quant.) with trifluoroacetic acid gave the corresponding 1-hydroxy compound **13**. Treatment[15] of **13** with trichloroacetonitrile in the presence of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) gave the α-trichloroacetimidate **14** (94%). Treatment of a mixture of imidate **14** and 2-tetradecylhexadecanol with TMSOTf (0.08 equiv, 72 h) afforded the 1,2-orthoester, which was further converted into the desired β-glycoside (46%) by the addition of TMSOTf (0.16 equiv) and additional stirring (24 h). Finally, removal of all the protecting groups under basic conditions furnished the target molecule in 92%. Significant signals in the ^{1}H NMR spectrum of **16** were four one-proton doublets at 4.26, 4.43, 4.49 and 4.59 ($J_{1,2}$ 7.7–8.0 Hz, four β-anomeric-H), showing the finally formed glycosidic linkage to be β. In the fast-atom bombardment (FAB) mass spectrum of **16**, the molecular ion of $[M-H]^-$ was clearly detected at *m/z* 1767.1, providing evidence for the assigned structure (Scheme 3).

The reactivity of antibodies, NCC-ST-439, CSLEX-1 and GSC154-27, against the sialyl Lewis X determinant carried by various internal structures, was examined.[16] Antibody NCC-ST-439 was initially raised against human stomach cancer cell line ST-4,[4] and GSC154-27 against the conventional sialyl Lewis X determinant on branched polylactosamine structure.[17] CSLEX-1 is known to react with the sialyl Lewis X related-determinant independent from the inner structures. The specificity of the three antibodies is summarized in Table 1. It is clear that antibody NCC-ST-439 is specifically reactive to the sialyl Lewis X carried by the GlcNAcβ1-6GalNAcα mucin core. This core structure is known to be present in mucin glycoproteins, but not in glycolipids. Trials over a long period to find a glycolipid antigen recognized by NCC-ST-439 in tumor tissues have so far been unsuccessful. The chemical approach, design and synthesis of a novel neo-glycolipid could meet with success in determining the structures recognized by the antibody NCC-ST-439 as shown here.

3. Experimental

Optical rotations were determined with a Union PM-201 polarimeter at 25 °C. ^{1}H NMR spectra were recorded at 400 MHz with a Varian Inova 400, or 500 MHz with a Varian Inova 500 spectrometer. FAB-MS were recorded on a JEOL JMS-SX 120A mass spectrometer/JMA-DA 7000 data system. Preparative TLC was performed on Silica Gel 60 (E. Merck), and column chromatography on silica gel (Fuji Silysia Co., 300 mesh) was accomplished with the solvent system (v/v) specified. Concentrations and evaporations were conducted in vacuo.

3.9. 2-(Trimethylsilyl)ethyl *O*-(methyl 5-acetamido-4,7,8,9-tetra-*O*-acetyl-3,5-dideoxy-D-*glycero*-α-D-*galacto*-2-nonulopyranosylonate)-(2→3)-*O*-(2,4,6-tri-*O*-benzoyl-β-D-galactopyranosyl)-(1→4)-*O*-[(2,3,4-tri-*O*-acetyl-α-L-fucopyranosyl)-(1→3)]-*O*-(2-acetamido-6-*O*-acetyl-2-deoxy-β-D-glucopyranosyl)-(1→6)-*O*-[(2,3,4,6-tetra-*O*-acetyl-β-D-galactopyranosyl)-(1→3)]-*O*-(2-acetamido-4-*O*-acetyl-2-deoxy-α-D-galactopyranosyl)-(1→3)-*O*-(2,4,6-tri-*O*-acetyl-β-D-galactopyranosyl)-(1→4)-2,3,6-tri-*O*-acetyl-α-β-D-glucopyranose 13

To a solution of **12** (225 mg, 91.9 μmol) in CH_2Cl_2 (2 mL), cooled to 0 °C, was added CF_3COOH (2 mL), and the mixture was stirred for 1 h at room temperature and concentrated. The product was applied for the next reaction without further purification.

3.10. *O*-(Methyl 5-acetamido-4,7,8,9-tetra-*O*-acetyl-3,5-dideoxy-D-*glycero*-α-D-*galacto*-2-nonulopyranosylonate)-(2→3)-*O*-(2,4,6-tri-*O*-benzoyl-β-D-galactopyranosyl)-(1→4)-*O*-[(2,3,4-tri-*O*-acetyl-α-L-fucopyranosyl)-(1→3)]-*O*-(2-acetamido-6-*O*-acetyl-2-deoxy-β-D-glucopyranosyl)-(1→6)-*O*-(2-acetamido-3,4-di-*O*-acetyl-2-deoxy-α-D-galactopyranosyl)-(1→3)-*O*-(2,4,6-tri-*O*-acetyl-β-D-galactopyranosyl)-(1→4)-2,3,6-tri-*O*-acetyl-α-D-glucopyranosyl trichloroacetimidate 14

To a solution of the product obtained above in CH_2Cl_2 (2 mL), cooled to 0 °C, was added trichloroacetonitrile (270 μL, 2.69 mmol) and DBU (13.0 μL, 86.9 μmol). The mixture was stirred for 1 h at 0 °C, and the progress of the reaction was monitored by TLC. After completion of the reaction, the mixture was concentrated. Column chromatography (35:1 CH_2Cl_2–CH_3OH) of the residue on silica gel gave **14** (175 mg, 89%): $[\alpha]_D = +14.3$ (*c* 1.8, $CHCl_3$); IR (film) 3350, 2950, 1750, 1680, 1520, 700 cm^{-1}; ^1H NMR ($CDCl_3$): δ 1.22 (d, 3H, $J_{5,6} = 6.4$ Hz, H-6g), 1.60–2.16 (19s, 57H, 3AcN, 16AcO), 1.62 (t, 1H, $J_{gem} = J_{3ax,4} = 12.6$ Hz, H-3f*ax*), 2.42 (dd, 1H, $J_{3eq,4} = 4.6$ Hz, H-3f*eq*), 3.81 (s, 3H, COOMe), 4.52 (m, 1H, H-2c), 4.71 (m, 1H, H-4f), 5.08 (d, 1H, $J_{1,2} = 9.8$ Hz, H-1e), 5.44 (d, 1H, $J_{3,4} = 3.8$ Hz, H-4e), 5.57 (t, 1H, $J_{2,3} = 9.7$ Hz, H-2e), 5.67 (m, 1H, H-8f), 5.72 (d, 1H, $J_{2,NH} = 8.9$ Hz, NH-d), 6.06 (d, 1H, $J_{2,NH} = 9.6$ Hz, NH-c), 6.51 (d, 1H, $J_{1,2} = 3.9$ Hz, H-1a), 7.43–8.18 (m, 15H, 3Ph), 8.68 (s, 1H, C=NH). 3.11. 2-(Tetradecyl)hexadecyl *O*-(methyl 5-acetamido-4,7,8,9-tetra-*O*-acetyl-3,5-dideoxy-D-*glycero*-α-D-*galacto*-2-nonulopyranosylonate)-(2→3)-*O*-(2,4,6-tri-*O*-benzoyl-β-D-galactopyranosyl)-(1→4)-*O*-[(2,3,4-tri-*O*-acetyl-α-L-fucopyranosyl)-(1→3)]-*O*-(2-acetamido-6-*O*-acetyl-2-deoxy-β-D-glucopyranosyl)-(1→6)-*O*-(2-acetamido-3,4-di-*O*-acetyl-2-deoxy-α-D-galactopyranosyl)-(1→3)-*O*-(2,4,6-tri-*O*-acetyl-β-D-galactopyranosyl)-(1→4)-2,3,6-tri-*O*-acetyl-β-D-glucopyranoside 15

To a solution of **14** (217 mg, 87.1 μmol) and 2-(tetradecyl)hexadecanol (115 mg, 0.26 μmol) in dry CH_2Cl_2 (7 mL) were added molecular sieves 4 Å (AW-300,

0.5 g), and the mixture was stirred for 4.5 h at room temperature and then cooled to 0 °C. TMSOTf (1.3 μL, 6.72 μmol) was added to the mixture, which was stirred for 72 h at 0 °C and for another 24 h after the addition of TMSOTf (2.6 μL, 13.4 μmol). After completion of the reaction, the solids were filtered off and washed with $CHCl_3$. The combined filtrate and washings was washed with 1 M $NaHCO_3$ and water, dried over Na_2SO_4, and concentrated. Column chromatography (30:1 $CHCl_3$–CH_3OH) of the residue on silica gel gave **14** (111 mg, 46%): $[\alpha]_D$ = +9.2 (*c* 1.1, $CHCl_3$); IR (film) 3350, 2950, 1750, 1680, 1520, 700 cm^{-1}; ^1H NMR ($CDCl_3$): δ 0.88 (t, 6H, J = 6.6 Hz, $2CH_3$), 1.22 (d, 3H, $J_{5,6}$ = 6.4 Hz, H-6g), 1.24–1.43 (m, 53H, $26CH_2$ and CH), 1.58–2.15 (19s, 57H, 3AcN, 16AcO), 2.42 (dd, 1H, J_{gem} = 12.8, $J_{3eq,4}$ = 4.3 Hz, H-3f*eq*), 3.81 (s, 3H, COOMe), 4.54 (m, 1H, H-2c), 4.72 (m, 1H, H-4f), 5.01 (d, 1H, $J_{1,2}$ = 3.2 Hz, H-1c), 5.66 (m, 1H, H-8f), 5.69 (d, 1H, $J_{2,NH}$ = 8.4 Hz, NH-d), 6.02 (d, 1H, $J_{2,NH}$ = 9.6 Hz, NH-c), 7.43–8.16 (m, 15H, 3Ph). 4. Reactivity of antibodies

Reactivity of antibodies was measured by ELISA, which was performed using glycolipid antigens immobilized at the bottom of 96-well culture plates by a standard method described previously.[18] Peroxidase-conjugated goat anti-mouse IgM (μ-chain specific) was obtained from Cappel Inc. (Malvern, PA).

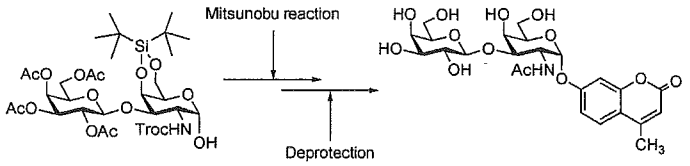
ABSTRACT



We have succeeded in the facile synthesis of 4-methylumbelliferyl T-antigen as a substrate for *endo*-α-*N*-acetylgalactosaminidase by exploiting the combination of the di-*tert*-butylsilylene effect and the Mitsunobu reaction.

endo-α-*N*-Acetylgalactosaminidase is a glycosidase of widespread occurrence in the bacteria kingdom.[1] The enzyme hydrolyzes the *O*-glycosidic α-linkage between T-antigen [β-D-Gal-(1→3)-α-D-GalNAc] and a serine or threonine residue in mucin-type glycoprotein.[2] To elucidate the substrate specificity of this enzyme, or screen the new species from other living organisms, sensitive synthetic fluorogenic T-antigen probes are intensively desired.

In this paper, we report the synthesis of 4-methylumbelliferyl (4-MU) T-antigen **1** (Figure 1) as a sensitive fluorogenic probe, featuring a di-*tert*-butylsilylene (DTBS)-directed α-selective Mitsunobu reaction.

4-MU glycosides have been popular type of fluorogenic probe for hydrolases because of the potent fluorometric property of the phenolic counterpart liberated by enzymatic hydrolysis.[3] However, the 4-MU glycoside synthesis is generally difficult.[4] In particular, the synthesis of α-glycosaminides such as the title compound is extremely arduous in order to circumvent the participatory effects of the *N*-acetyl group. In their synthesis of 4-MU-α-GalNAc, Lemieux and co-workers utilized 2-azidogalactosyl chloride as a glycosyl donor as it possesses a nonparticipatory group at C2. Unfortunately, its synthesis required many laborious manipulations. Moreover, the glycosyl donor could only be coupled to 4-methylumbelliferone (4-MU-OH) in poor yield (33%).[5] To solve this synthetic issue, we envisaged using
