### Rapid Infusion Method and Its Optimal Monitoring Places of Core Temperature

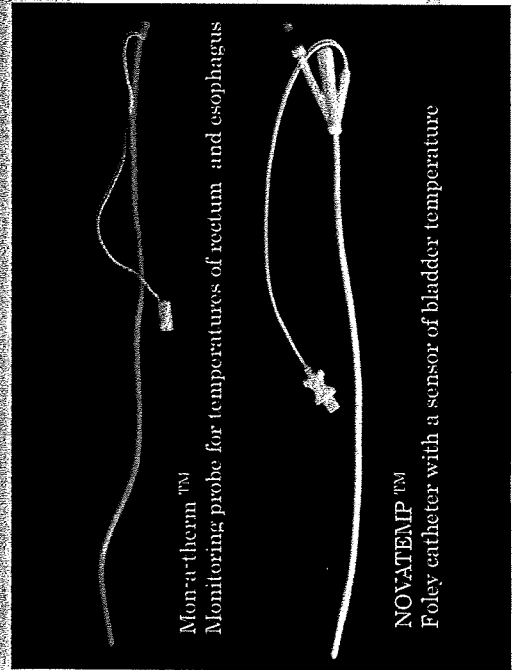

#### 患者

駿河台日本大学病院救命センターに搬送されてきた院外心肺停止患者で、J-PULSE-Hypo. Registryの登録基準に該当する患者とした。

#### 方法

患者が救命センターに到着して間もなく、両上肢または両臍径部のいずれか2か所に18ゲージ以上の太い静脈路を確保し、そこから加圧バッグ(>300 mmHg)に取り付けられた4℃の生理食塩水を合計2000mL投与した(Circulation 2007; 115: 3064-3070)の方法に準拠した。その際の深部体温は膀胱、直腸、食道でモニターした。

### Monitoring Probe of Core Temperature

### Ice-cold Normal Saline (4°C) with a High-pressure Bag

### The Interval from Initiation of Intravenous Icecold Fluids (2000mL) to Completion of the Fluids.

## Core Temperatures Esophagus vs. Bladder vs. Rectum

## Discussion

- ・J-PLUSE-Hypo Registryにおいて、IV groupではno-IV groupに比し、良好な神経学的転帰が得られた。冷却水輸液は導入が簡便なため、初期診療時により早期に導入にできたことが要因であると考えられる。
- ・冷却水輸液を行うことで合併症や輸血の機会が増すことはなかった。
- ・そのため、冷却水輸液は迅速、簡便、安価、安全であるため、冷却水輸液による脳低体温療法の導入を積極的に行うべきである。

## Discussion

・加圧バッグに取り付けられた2000mLの冷却水は、13分程度で投与完了することができ、30分後には深部体温で35°C前後まで低下していることが判明した。

・今回食道温は膀胱温や直腸温と比べ、常に2°C程度低値を示した。これは初期診療時には外気温や換気の影響を受けやすいこと、測定デバイスが適切な位置に留置しにくいことなどが原因として挙げられる。

・深部体温の低下の程度は、輸液の温度と投与量、患者の体型、外気温などにより規定されると考えられるため、さらなる症例の蓄積が必要と考えられる。

## Conclusion

- 冷却水輸液を用いた迅速な脳低体温療法の導入は、院外VF心停止蘇生後の昏睡患者の神経学的転帰に寄与する。
- 初期診療時の深部体温のモニタリングとして、食道温は過大評価を生じる可能性がある。

## **The Impact of Percutaneous Cardiopulmonary Assisted Devices to Treat Patients under Therapeutic Hypothermia in Hemodynamic Compromised State**

**Background:** Therapeutic hypothermia (TH) improves neurological outcomes of patients with out-of-hospital cardiac arrest (OHCA), however, impact of cardiopulmonary assisted devices (PCPS) to treat the patients with prolonged cardiogenic shock under therapeutic hypothermia (HT) have not been sufficiently studied.

**Methods:** Four years (2005-2008) data were available for 281 patients after OHCA treated with TH in the multicenter registry in Japan. In this study, 57 patients (20.3%) were treated with PCPS. We evaluated factors to influence on favorable neurologic outcome (FNC) in the patients treated with PCPS under TH.

**Results:** In the patients treated with PCPS, 18 patients showed good out-come with FNC (FNC-group) and 39 had not good out-come with FNC (Non-FNC-group). Although there was no significant in age, gender, the presence of bystanders, initial ECG findings, arterial pH and arterial base excess, but FNC-group showed significantly shorter time of the collapse to return of spontaneous circulation (ROSC) interval, higher rate of ROCS before admission and higher maximum blood pressure after ROSC ( $27.9 \pm 24.0$ min, 50.0% and  $136 \pm 44$ mmHg, respectively) than Non-FNC-group ( $66.1 \pm 37.3$ min, 7.7% and  $96 \pm 28$ mmHg, respectively,  $p < 0.01$ ).

**Conclusions:** The patients treated with TH using PCPS were reached FNC at 30 days up to 31.6%. Time of the collapse to ROSC interval, ROSC before admission and blood pressure after ROSC were important factors to become FNC.

Impacts of Percutaneous Cardiopulmonary Assisted Devices to Treat Patients under Therapeutic Hypothermia in Compromised State

FINANCIAL DISCLOSURE: None

UNLABELED/UNAPPROVED USES DISCLOSURE: None

JCS 2010

## Backgrounds

Although it has been reported that therapeutic hypothermia (TH) improves neurological outcomes of patients with cardiac arrest, procedures of the hypothermia remain to be established.

Particularly, impact of cardiopulmonary assisted devices (PCPS) to treat the patients with prolonged cardiogenic shock under TH has not been sufficiently studied.

JCS 2010

## Objective

To investigate the efficacy of TH including PCPS in patients with return of spontaneous circulation (ROSC) after resuscitation from out-of-hospital or in-hospital cardiac arrest.

JCS 2010

## Study Populations

281 consecutive patients with ROSC after resuscitation treated with TH in the multicenter registry in Japan (J-Pulse-Hypo registry) for 4 years (2005-2008).

### <Inclusion criteria>

- Adult patients who remained unconscious after resuscitation from out-of-hospital or in-hospital cardiac arrest.
- Presented the stable hemodynamics with treatment or mechanical supporting system including IABP or PCPS.

### <Exclusion criteria>

- pregnancy
- dissection of aorta
- pulmonary thromboembolism
- drug poisoning
- poor daily activity

## Study Organization

### Principle Investigator:

Hiroshi Nonogi

### Working members:

Ken Nagao, Hiroyuki Yokoyama, Yohio Tahara, Shinichi Shirai, Shunji Kasaoka, Kazunori Kashivase, Yuichi Motomura, Tomotaka Sawano, Mamoru Hase, Takuro Hayashi, Tatsuya Maruhashi, Yuji Yasuga, Nobutaki Kokabu, Yoritaka Otsuka, Hideaki Arimoto, Kazui Soma, Yasuhiro Kuroda, Hiroshi Hazui

### Bio statisticians:

Naohiro Yonemoto, Akiko Kada

### Participating institution:

National Cardiovascular Center  
 Nihon University Surugadai Hospital  
 Osaka Police Hospital  
 Saga University Hospital  
 Hiroshima City Hospital  
 Takatsuki Red Cross Hospital  
 Yamaguchi University Hospital  
 Kagawa University Hospital  
 Sapporo Medical University Hospital  
 Yokohama City University Hospital  
 Kokura Memorial Hospital  
 Saiseikai Senri Hospital  
 Osaka City University Hospital  
 Kitazato University Hospital  
 Mishima Emergency critical Center  
 Sumitomo Hospital

## Methods-1

Selection of cooling procedure was left to each institution.

The patients with hemodynamic compromised state were treated with PCPS (PCPS group).

PCPS group: n=57 (20%)  
 Non-PCPS group: n=224 (80%)

## Methods-2

We evaluated clinical characteristics of the patients treated with PCPS under TH, and factors to influence on favorable neurologic outcome (FNC) in patients treated with PCPS.

Primary end point of this study was FNC, cerebral performance category (CPC) 1 and 2 rate at 30 days.

## Clinical characteristics of patients treated with TH

### All patients (n = 281)

Age (years)	58 ± 13
Male	235 (84%)
Initial cardiac rhythm	196 (69%)
Ventricular fibrillation	26 (9%)
Pulseless electrical activity	21 (8%)
Asystole	37 (13%)
Unidentified	247 (88%)
Witnessed cardiac arrest	145 (52%)
Bystander CPR	267 (95%)
OHCA	167 (60%)
ROSC before admission	37.8 ± 50.9
Collapse to ROSC interval (min)	170 (60%)
Acute coronary syndrome	122 (43%)
Emergency PCI	57 (20%)
PCPS use	108 (38%)
IABP use	123 (44%)
FNC rate at 30 days	

Data are presented as mean value ± SD or number (%) of patients.

CPR, cardiopulmonary resuscitation; IABP, intra aortic balloon pumping;

OHCA, out of hospital cardiac arrest; PCI, percutaneous coronary intervention.

JCS 2010

## Clinical characteristics between PCPS group and non-PCPS group

	PCPS group (n = 57)	Non-PCPS group (n = 224)	p value

## FNC rate at 30 days between PCPS group and non-PCPS group

JCS 2010

## Comparison between FNC(CPC1/2) category and Non-FNC(CPC 3/4) category in PCPS group

	FNC group (CPC1/2) (n = 18)	Non-FNC group (CPC3/4) (n = 39)	p value
OHCA	16 (89%)	38 (97%)	0.20
ROSC before admission	9 (50%)	4 (10%)	<0.01
Collapse to ROSC interval (min)	42.6 ± 32.5	79.2 ± 51.6	<0.01
Acute coronary syndrome	16 (89%)	25 (64%)	0.04
Emergency PCI	11 (61%)	25 (64%)	0.33
IABP use	12 (67%)	31 (79%)	0.30
Maximum BP after ROSC(mmHg)	136 ± 44	96 ± 28	<0.01
Initiation cooling to target temperature (min)	113 ± 105	145 ± 185	0.43
Arterial blood pH	7.11 ± 0.20	7.03 ± 0.20	0.17
Arterial blood Base Excess(mmol/l)	-14.9 ± 7.8	-17.0 ± 5.7	0.27
Blood Sugar(mg/dl)	260 ± 114	316 ± 119	0.11

Data are presented as mean value ± SD or number (%) of patients

JCS 2010

## Summary

To compare with non-PCPS group, PCPS group showed much less FNC rate at 30 days.

Although PCPS group showed much hemodynamic compromised state in maximum blood pressure, rate of ROSC before admission, collapse to ROSC interval, blood sugar, pH and base excess of arterial blood gas at admission, PCPS group was more treated with PCI and IABP than in non-PCPS group.

Patients with FNC in PCPS group showed higher maximum blood pressure, more often coronary artery syndrome, higher rate of ROSC before admission and shorter collapse to ROSC interval than patients without FNC.

JCS 2010

## Conclusions

The patients treated with TH using PCPS, even who were in very ill condition, were reached FNC at 30 days up to 31.6%.

Higher maximum blood pressure after ROSC, cardiac arrest due to acute coronary syndrome, ROSC before admission and collapse to ROSC interval were important factors of FNC in PCPS group.

JCS 2010

*Efficacy of Therapeutic Hypothermia for Out-of-Hospital Cardiac Arrest in Patients with Non-Ventricular Fibrillation: J-PULSE-Hypo Registry*

Yoshio Tahara, Kazuo Kimura, Noriyuki Suzuki, Ken Nagao, Naohiro Yonemoto, Hiroyuki Yokoyama, Hiroshi Nonogi and the J-PULSE-Hypo Investigators

**Background:** Two randomized trials and a meta-analysis showed therapeutic hypothermia improved survival and neurological outcomes in adults who remained comatose after initial resuscitation from out-of-hospital cardiac arrest due to ventricular fibrillation (VF). However, whether therapeutic hypothermia is effective for cardiac arrest without VF remains unclear.

**Methods:** We conducted a multicenter retrospective study at 12 institutions to evaluate the effect of therapeutic hypothermia on out-of-hospital cardiac arrest between January 2005 and December 2007. Enrolled patients were divided into the VF group, pulseless electrical activity (PEA) group, and asystole group according to the initial rhythm, and neurologic outcomes at discharge from the hospital were compared. A favorable outcome was defined as a Cerebral Performance Category (CPC) of 1-2.

**Results:** A total of 281 patients were enrolled. The mean age was  $58 \pm 13$  years. Men accounted for 84% of all patients. The median interval from collapse to return of spontaneous circulation was 18 (13-25) minutes. As compared with the asystole group (N=16), the VF group (N=239) and the PEA group (N=26) had higher rates of favorable outcomes (VF 62%; PEA 35%; asystole 6%,  $p < 0.01$ ).

**Conclusions:** Our results suggested that therapeutic hypothermia was effective not only for out-of-hospital cardiac arrest due to VF, but also for cardiac arrest due to causes other than VF, particularly PEA. Further larger studies are needed to confirm our results.

PCPS (%)	0	31	0.04

## Limitations

- PEAとAsystoleの症例数が少ない。
- 低体温療法への適応および管理基準が施設間で異なる。
- J-PULSE Hypo参加施設で治療した院外心停止全体のアウトカムが不明である。

## まとめ

- 院外心停止蘇生後に対して低体温療法はVF症例のみならず、非VF（特にPEA）症例に対しても効果があることが示唆された。
- さらなる症例の集積により検討を要する。

J-PULSE  
 hypothermia  
 registry

*Relationship between favorable neurological outcome and time interval from collapse to ROSC in patients treated with hypothermia:*

*J-PULSE-Hypo; a multi-center observational study*

*Taketomo Soga, Ken Nagao*

*Naohiro Yonemoto, Hiroyuki Yokoyama*

*Hiroshi Nonogi and the J-PULSE-Hypo Investigators*

**Background-** Clinical evidence strongly supported mild hypothermia as an effective therapy for patients with return of spontaneous circulation (ROSC) after out-of-hospital cardiac arrest, but the patients who may benefit from this treatment have not been fully elucidated. We investigated the relationship between neurological benefits and time interval from collapse to ROSC.

**Methods and Results-** We did a multicenter observational study of therapeutic hypothermia for unconscious adult patients with ROSC after out-of-hospital cardiac arrest. The committee entrusted each hospital with timing of cooling, cooling methods, target temperature, duration, and rewarming rate. The primary endpoint was a favorable neurological outcome at hospital discharge.

A total of 281 patients were enrolled in this study. Of those, a favorable neurological outcome was seen in 157(55.9%). A median (IQR) collapse-to-ROSC interval was 25 (17-40) min, and the collapse-to-ROSC interval of patients with favorable neurological outcome was shorter than that with unfavorable neurological outcome (median; 18 min vs. 34 min,  $p < 0.0001$ ). The collapse-to-ROSC interval cutoff value of 25.5 min had an accuracy of 76.0% for identification of a favorable neurological outcome. In addition, a collapse-to-ROSC interval of 65.5 min had a negative predictive of 100% for a favorable neurological outcome. In the multiple logistic-regression analysis, a collapse-to-ROSC interval cutoff value of 25.5 min was an independent predictor of a favorable neurological outcome.

**Conclusions-** In patients undergoing mild hypothermia after ROSC, time interval from collapse to ROSC was an independent predictor for a favorable neurological outcome. Further research is needed in patients with prolonged CPR of 25 min or longer.

## 低体温療法プロトコル

4℃の細胞外液を30～60分以内に投与し、低体温療法を導入する。

- 低体温療法の維持方法
  - 1) Surface cooling (a: Cooling Blanket (Blanketrol II, CSZ medical, Cincinnati, OH, USA, b: Cooling device with self-adhesive, hydrogel-coated pads (Arctic Sun, Medivance, Louisville, KY, USA),
  - 2) Blood cooling (c: Extracorporeal direct blood cooling (KTEK-III, Kawasaki, Tokyo, Japan, d: Endovascular cooling device (CoolGard 3000, Alsius, Irvine, CA, USA).
- 低体温療法の目標深部体温は32～34℃、冷却期間は24～72時間。
- 復温は緩徐に行い、少なくとも24～72時間をかけて行う。

## Study endpoints

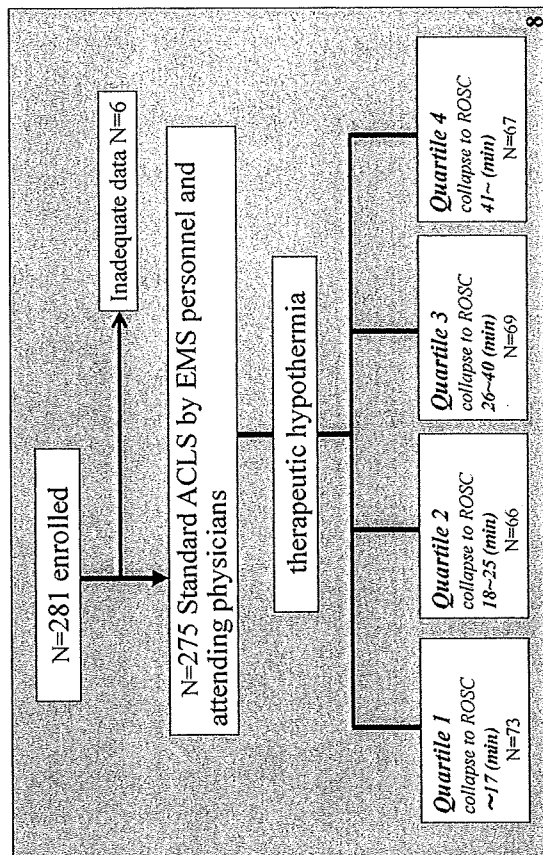

The primary endpoint : 30日後の良好な神経学的転帰とする(CPC 1or2)。  
 The secondary endpoint: 24時間、1週間、30日後生存率とする。

## 目的

心停止時間と良好な神経学的転帰の関係を検討する。

10

## secondary endpoint

12

Receiver-operating-characteristics (ROC) curves for various cutoff levels of the collapse-to-ROSC interval to differentiate a favorable neurological outcome and an unfavorable neurological outcome at 30 days survival

Adjusted odds ratios for a favorable neurological outcome at 30 days survival associated with selected factors, from the multiple logistic-regression analysis

## Complications

## Conclusions

- Hypothermiaは院外心臓性心停止患者において有用、有効な手法である。
- 本研究において、現行のhypothermiaは、約6割の社会復帰率を得られるとの結果。
- 心停止時間が25分以内であれば、約8割の社会復帰率を認め、25分以内の心停止はhypothermiaの至適対象となりうる。
- 25以上の心停止、初回心電図がVF/VT以外の症例においては、さらなる研究や戦略が必要である。
