

Cat 2: *Bungarus flaviceps*, *Cryptelytrops macrops*, *Naja siamensis* (south);
Protobothrops mucrosquamatus (north); *Bungarus fasciatus*, *Ophiophagus hannah*, *Viridovipera stejnegeri*

Australo-Papua (Including Pacific Islands):

There are no medically important land snakes in American Samoa, Cook Islands, Fiji, French Polynesia, Guam, Kiribati, Marshall Islands, Nauru, New Caledonia, New Zealand, Northern Mariana Islands, Pitcairn Island, Samoa, Tokelau, Tonga, Tuvalu, or Wallis and Futuna Islands. Fiji possesses a single terrestrial venomous snake species (*Ogmodon vitianus*) while the Solomon Islands possess three terrestrial venomous species (*Salomonelaps elapoides*, *Loveridgelops salomonis* and *Parapistocalamus par*) with no, and few, snakebites respectively.

Australia: Approximately 1,100-1,500 snakebite envenomings occur in Australia annually with an average incidence of 4.76/100,000/year (Currie, 2000). The number of deaths due to snakebite ranges from 2-5 (0.01-0.02/100,000/year). Brown snakes (*Pseudonaja textilis* etc.) cause most bites and deaths, followed by tiger snakes (*Notechis scutatus* etc.).

Cat 1: *Notechis scutatus*, *Pseudonaja affinis*, *Pseudonaja nuchalis*, *Pseudonaja textilis*

Cat 2: *Acanthophis antarcticus*, *Acanthophis* spp., *Austrelaps* spp., *Hoplocephalus* spp., *Oxyuranus scutellatus*, *Oxyuranus microlepidotus*, *Oxyuranus temporalis*, *Pseudechis australis*, *Pseudechis* spp., *Tropidechis carinatus*

Indonesia (West Papua & Makulu): It is important to recognise that the fauna of West Papua Province is Australo-Papuan in origin and hence the venomous snake fauna are biogeographically distinct from that of the rest of Indonesia. The smooth-scaled death adder (*Acanthophis laevis*) is the most widespread venomous species in West Papua.

Cat 1: *Acanthophis laevis*

Cat 2: *Acanthophis rugosus*, *Micropechis ikaheka*, *Oxyuranus scutellatus*, *Pseudechis papuanus*, *Pseudechis rossignoli*, *Pseudonaja textilis*

Papua New Guinea: The incidence of bites was 215/100,000/year with a mortality rate of 7.9/100,000/year in Central Province while in Kairuku subprovince there were 526 bites/100,000/year (Lalloo *et al*, 1995). It is estimated that there are 3200 bites with about 500-1500 snakebite envenomings and 200 deaths in Papua New Guinea (Data: Australian Venom Research Unit; Williams, 2005). The most important species are taipans (*Oxyuranus scutellatus*), and smooth-scaled death adders (*Acanthophis laevis*.)

Cat 1: *Acanthophis laevis*, *Oxyuranus scutellatus*

Cat 2: <i>Vipera aspis, Vipera berus</i>
--

United Kingdom: There are more than 200 adder (*Vipera berus*) bites each year but there have been only 14 deaths during the last hundred years, the last in 1975 (Warrell 2005a).

Cat 1: <i>Vipera berus</i>

Cat 2: None

THE AMERICAS

North America

USA and Canada

Of the estimated 45,000 bites and 7,000-8,000 treated snakebites each year in USA (and a few in Canada), 70% are attributed to rattlesnakes, 20% to copperheads, 9% to cottonmouth water moccasins and 1% to coral snakes or exotic other species. From 2001-2005 an average of 4,800 native venomous snake exposures/year and 50 exotic venomous snake exposures/year were reported to poison centers (Seifert et al, 2007; Seifert, 2008a,b) The number of snakebite deaths reported range from 5 to 10 (Forrester and Stanley, 2004). The very few fatal cases each year are caused by rattlesnakes (*Crotalus adamanteus*, *C. atrox*, *C. horridus*, *C. oreganus*, *C. scutulatus*, and *C. viridis*).

Canada

Cat 1: *Agkistrodon bilineatus, Agkistrodon taylori, Crotalus atrox, Crotalus scutulatus, Crotalus simus, Crotalus totonacus, Bothrops asper*

Cat 2: *Agkistrodon contortrix, Atropoides spp., Bothriechis spp., Cerrophidion spp., Crotalus basiliscus, Crotalus molossus, Crotalus oreganus, Crotalus ruber, Crotalus viridis, Crotalus spp., Ophryacusspp., Micruroides euryxanthus, Micrurus tener, Micrurus spp., Porthidium spp., Sistrurus miliaris, Sistrurus catenatus*

Central America

The most medically important species are *Crotalus simus* and *Bothrops asper*. In Central American countries, the average annual rate of bites is 600 in Costa Rica, 600-1000 in Guatemala and Honduras, 500 in Nicaragua (Gutiérrez *et al.*, 2006) and 2,000-2,500 in Panama (Gutiérrez *et al.*, 2006; Ministerio de Salud, Panama). A few cases occur in El Salvador and Belize. Fatalities have decreased to almost zero in Costa Rica and in Mexico.

Belize: There are no published epidemiological data available.

Cat 1: *Bothrops asper*

Cat 2: *Agkistrodon bilineatus, Atropoides mexicanus, Bothriechis schlegelii, Crotalus tzabcan, Micrurus spp., Porthidium nasutum*

Costa-Rica: The incidence of envenoming was estimated at 20/100,000/year in 1995, translating to approximately 680 cases/year (Rojas *et al.*, 1997). Recent estimates cite 500-600 envenomings (11-13/100,000/yr) and 0-5 deaths (0.1/100,000/year) in Costa-Rica (Sasa & Vázquez, 2003; Gutiérrez *et al.*, 2006).

Cat 1: *Bothrops asper, Crotalus simus*

Cat 2: *Agkistrodon bilineatus, Atropoides spp., Bothriechis schlegelii, Bothriechis lateralis, Bothriechis spp., Cerrophidion godmani, Lachesis melanocephala, Lachesis stenophrys, Micrurus nigrocinctus, Micrurus spp., Porthidium nasutum, Porthidium spp.*

El Salvador: There are about 50 cases of envenoming per year (Gutiérrez *et al.*, 2006).

Cat 1: *Crotalus simus*

Cat 2: *Agkistrodon bilineatus Atropoides occiduus, Cerrophidion godmani, Micrurus nigrocinctus, Porthidium ophryomegas*

This document is not issued to the general public, and all rights are reserved by the World Health Organization (WHO). Guatemala: About 600-1000 envenomings are reported annually (Gutiérrez *et al.*, 2006).

Cat 1: <i>Bothrops asper, Crotalus simus</i>
Cat 2: <i>Agkistrodon bilineatus, Atropoides spp., Bothriechis schlegelii, Bothriechis spp., Cerrophidion godmani, Micrurus nigrocinctus, Micrurus spp., Porthidium nasutum, Porthidium ophryomegas,</i>

Honduras: There are 600-1000 envenomings in Honduras (Gutiérrez *et al.*, 2006).

Cat 1: <i>Bothrops asper</i>
Cat 2: <i>Agkistrodon bilineatus, Atropoides spp., Bothriechis marchi, Bothriechis schlegelii, Bothriechis spp., Cerrophidion godmani, Crotalus simus, Micrurus nigrocinctus, Micrurus spp., Porthidium nasutum, Porthidium ophryomegas</i>

Nicaragua: About 800 envenomings are reported per year (Gutiérrez *et al.*, 2006).

Cat 1: <i>Bothrops asper, Crotalus simus</i>
Cat 2: <i>Agkistrodon bilineatus, Atropoides mexicanus, Bothriechis lateralis, Bothriechis spp, Bothriechis schlegelii, Cerrophidion godmani, Lachesis stenophrys, Micrurus nigrocinctus, Micrurus spp., Porthidium nasutum, Porthidium ophryomegas</i>

Panamá: About 2,000-2,500 envenomings occur annually (Gutiérrez *et al.*, 2006).

Cat 1: <i>Bothrops asper</i>
Cat 2: <i>Bothriechis lateralis, Bothriechis schlegelii, Bothriechis spp., Cerrophidion godmani, Lachesis acrochorda, Lachesis stenophrys, Micrurus nigrocinctus, Micrurus spp., Porthidium nasutum, Porthidium spp.</i>

Caribbean

No medically important snakes occur naturally in Anguilla, Antigua and Barbuda, Bahamas, Barbados, Bermuda, British Virgin Islands, Caymen Islands, Cuba, Dominica, Dominican Republic, Grenada, Guadeloupe, Haiti, Jamaica, Montserrat, Netherland Antilles, St Kitts and Nevis, St Vincent and Grenadine and Turks and Caicos Island.

Aruba, Martinique, St Lucia, Trinidad and offshore islands: About 20 snakebite envenomings have been reported from Martinique each year (Thomas *et al.*, 1996). Among the other islands there are fewer than 50 bites per year with occasional deaths (Warrell 2004).

This document is not issued to the general public, and all rights are reserved by the World Health Organization (WHO). Ministry of Health (Gutiérrez *et al.*, 2006). *Bothrops asper*, *B. atrox* and other *Bothrops* spp. are mainly responsible.

Cat 1: <i>Bothrops asper, Bothrops atrox, Bothrops bilineatus, Crotalus durissus</i>

Cat 2: <i>Bothriechis schlegelii, Bothrops brazili, Bothrops spp., Lachesis acrochorda, Lachesis muta, Micrurus lemniscatus, Micrurus mipartitus, Micrurus spixii, Micrurus surinamensis, Micrurus spp., Porthidium nasutum, Porthidium lansbergii</i>
--

Ecuador: 1,200-1,400 cases of snakebite are treated in hospital each year caused by *Bothrops atrox*, *B. asper*, *B. bilineatus* and *Bothrocophias microphthalmus* (Data: Pan American Health Organisation). However, the total number of snakebite envenomings can be as high as 8,200 (Praba-Egge *et al.*, 2003). There are about 50 fatalities each year. *Bothrops xanthogrammus* is synonymous with *B. asper*.

Cat 1: <i>Bothrops asper, Bothrops atrox, Bothrops bilineatus, Lachesis muta</i>

Cat 2: <i>Bothriechis schlegelii, Bothrocophias microphthalmus, Bothrocophias hyoprora, Bothrops spp., Lachesis acrochorda, Micrurus lemniscatus, Micrurus mipartitus, Micrurus surinamensis, Micrurus spp., Porthidium spp.</i>
--

French Guiana: Approximately 100-200 snakebite envenomings are reported from French Guiana (Chippaux *et al.*, 1984).

Cat 1: <i>Bothrops atrox, Bothrops brazili, Bothrops bilineatus, Crotalus durissus</i>

Cat 2: <i>Lachesis muta, Micrurus lemniscatus, Micrurus surinamensis, Micrurus spp.</i>

Guyana: About 500 snakebites and 5 deaths are reported annually (Gutiérrez *et al* 2006)

Cat 1: <i>Bothrops atrox, Bothrops bilineatus, Bothrops brazili, Crotalus durissus</i>

Cat 2: <i>Bothrops taeniatus, Lachesis muta, Micrurus lemniscatus, Micrurus surinamensis, Micrurus spp.</i>

Paraguay: There are about 100 snakebite envenomings and 10 deaths reported annually (Gutiérrez *et al* 2006).

Cat 1: <i>Bothrops alternatus, Crotalus durissus</i>

Cat 2: <i>Bothrops jararaca, Bothrops jararacussu, Bothrops moojeni, Bothrops spp., Micrurus corallinus, Micrurus lemniscatus, Micrurus spp.</i>
--

Peru: It is estimated that 4,500 bites occur each year with more than 100 fatalities. In 2005, 1435 snakebites (5.1/100,000/year), including 28 deaths (0.1/100,000/year) were reported (Gutiérrez *et al.*, 2006). Important species include *Bothrops atrox*, *B. bilineatus* and other *Bothrops* spp.

Cat 1: <i>Bothrops atrox, Bothrops bilineatus, Bothrops pictus, Crotalus durissus, Lachesis muta</i>
Cat 2: <i>Bothriechis schlegelii, Bothrocophias spp., Bothrops spp., Micrurus lemniscatus, Micrurus mipartitus, Micrurus spixii, Micrurus surinamensis, Micrurus spp.</i>

Suriname: About 300 snakebite envenomings and two deaths have been reported.

Cat 1: <i>Bothrops atrox, Bothrops bilineatus, Bothrops brazili, Crotalus durissus</i>
Cat 2: <i>Lachesis muta, Micrurus lemniscatus, Micrurus surinamensis, Micrurus spp.</i>

Uruguay: Fewer than 100 bites are reported each year with very few fatalities. From 2000-2005 there were 347 cases (1.7/100,000/year) reported (Gutiérrez *et al.*, 2006). *Bothrops alternatus*, *B. jararaca*, *B. neuwiedi* sensu lato and other *Bothrops* spp. are the main causes.

Cat 1: <i>Bothrops alternatus, Crotalus durissus</i>
Cat 2: <i>Bothrops pubescens, Micrurus corallinus, Micrurus spp.</i>

Venezuela: *Bothrops asper* has been cited erroneously as the most important species, but this species is rare in Venezuela and localised to the north-west of the country. *Bothrops atrox* typically occurs south of Orinoco but a separate population of *Bothrops* cf *atrox* occurs in the north of Venezuela, and has been mistakenly identified as *Bothrops asper*. *Bothrops venezuelensis* may be of medical importance in some areas. The number of snakebite envenomings in Venezuela is about 7,000 per year (JM Gutierrez, Personal Communication). There about 40 deaths due to snakebite annually (De Sousa *et. al.*, 2005).

Cat 1: <i>Bothrops atrox, Bothrops cf. atrox, Bothrops venezuelensis, Crotalus durissus</i>
Cat 2: <i>Bothriechis schlegelii, Bothrops asper?, Bothrops brazili, Bothrops bilineatus, Bothrops spp., Lachesis muta, Micrurus lemniscatus, Micrurus mipartitus, Micrurus spixii, Micrurus surinamensis, Micrurus spp., Porthidium lansbergii</i>
