

### **12.2.4 Deaths, Discontinuations Due to Adverse Events, and Serious Adverse Events**

There were no deaths, discontinuations due to adverse events, or serious adverse events during this study in each study site.

## **12.3 Clinical Laboratory Evaluation**

Laboratory values (hematology, blood biochemistry and urinalysis) outside the normal reference range are flagged H (high) or L (low) as appropriate. Abnormal laboratory values by subject are listed in Appendix 8.2. Normal / abnormal rating shift in abnormal laboratory values are tabulated in Table 14.1. Summary statistics for laboratory values and shift tables for urinalysis parameters are presented in Tables 14.2 and 14.3, respectively. Follow-up/additional test by subject are listed in Appendix 8.6.

Although many subjects showed minor abnormalities in various laboratory values before and/or 48 hours after administration of the study drug, none of these except one (bilirubin in a Caucasian subject) was considered to be clinically significant. There were no apparent trends in laboratory parameters following administration of moxifloxacin.

## **12.4 Other Safety Assessments**

### **12.4.1 Renal Function**

Summary statistics for creatinine clearance are shown in Table 14.4. Individual creatinine clearance values before administration of the study drug are listed in Appendix 8.7.

Creatinine clearance values in each study site were as follows: 70 to <90 mL/min (1 in China, 4 in the US), 90 to <110 (6 in Japan, 4 in China, 3 in Korea, 9 in the US), 110 to <130 (8 in Japan, 10 in China, 10 in Korea, 6 in the US), 130 to <150 (4 in Japan, 5 in China, 3 in Korea, 1 in the US), 150 to <170 (2 in Japan, 3 in Korea).

### **12.4.2 Vital Signs**

Summary statistics for vital signs are shown in Table 14.5.

There were no clinically relevant abnormalities in vital signs, and no apparent trends following dose administration.

### 12.4.3 12-Lead ECG

Individual 12-lead ECG abnormalities at screening, before administration, at 3, 24 and 48 hours after administration of the study drug are listed in Appendix 8.3.

Although most subjects had minor abnormalities at some time during the study, none were considered to be clinically significant.

## 12.5 Safety Conclusions

Eighty eligible subjects were enrolled for this clinical pharmacokinetic study in order to investigate the pharmacokinetic profile of single oral dose of 400 mg of moxifloxacin in healthy adult male subjects among four ethnics. Of 80 subjects, one was withdrew his consent with personal reason and dropped out before administrating the study drug. All other subjects satisfied with all of the inclusion criteria and none of the exclusion criteria. Seventy-nine subjects completed the study and were evaluated for safety in each study site.

A total of 14 AEs (6 in 5 Japanese subjects, 1 in a Chinese subject, 4 in 3 Korean subjects and 3 in 3 Caucasian subjects) were observed during the study, of which it was considered that 4 events (urticaria in a Japanese subject, dizziness and headache in 2 Korean subjects, headache in a Caucasian subject) were considered to be probably related to the study drug. The most frequently reported AEs were malaise (3 incidents in 2 Japanese subjects) and headache (2 incidents in 2 Caucasian subjects and 1 incident in a Korean subject). All AEs except one incident of headache were mild in severity. AEs were generally short lasting and resolved without concomitant medication or other intervention. There were no deaths or serious AEs.

Laboratory measurements and clinical safety assessments (vital signs, physical examinations and 12-lead ECG) did not appear to show any clinically relevant abnormalities arising from the administration of moxifloxacin.

## **13. DISCUSSION AND OVERALL CONCLUSIONS**

All treatment-related AEs except one were mild in severity, and none required concomitant medication or intervention. Laboratory and other safety assessments did not appear to show any clinically relevant abnormalities arising from the administration of moxifloxacin. Moxifloxacin showed the similar safety results in these four ethnic groups.

The data from this study indicate that moxifloxacin given in oral dose of 400 mg is safe and relatively well-tolerated by healthy male Japanese, Chinese, Korean and Caucasian subjects.
