Figure legends

Fig. 1 Age distribution of disease onset in patients with RP

The mean age at onset of disease was 52.7 years old with a range from 3 to 97 years old.

Older people (more than 51 years old) tend to develop RP rather than younger people (0-20 years old).

Fig. 2 Effects of immunosuppressants to the airway involvement of RP patients

Prevalence rates of airway involvement in patients with RP were 100, 42.6, 50.0 and 57.0% in treatment with steroid only, steroid with MTX, CPA, CYA and AZP, respectively, with and/or after each treatment.

Fig. 3 Summary of prognostic outcome in patients with RP in this survey

Medication was discontinued without any manifestation in 11 patients (4.6%). 159 patients (66.5%) were well controlled and, in total, 71.1% of patients in our cohort responded to the treatments. 32 patients (13.4%) showed limited response and 9 patients (3.8%) suffered from progressive disease or relapse. 22 patients (9.0%) died.

Table 1 Summary of Japan RP Questionnaire

a. Patients' profile

Sex, onset age, follow-up years and diagnostic delay

b. Clinical features

Primary and follow-up

c. Laboratory findings

Laboratory tests, image analysis and histopathologic features

d. Treatment

Non-steroidal anti-inflammatory, prednisolone, immunosuppressants, antibiotics and surgical intervention

e. Prognosis and complications

Tracheal collapse, tracheotomy, vulvar surgery and death

Table 2 Characteristics of patients with RP in McAdam series¹⁰⁾ and current survey

	McAdam (n=159)	Current survey (n=239)		
Profile				
Male-female ratio	83:76	127:112		
Mean age		57 (range 6-104)		
Mean age of disease onset	44	53 (range 3-97)		
Disease duration (yr)		5.3 (range 1-33)
