喫煙、飲酒等生活習慣の実態把握及び生活習慣の改善に向けた研究

研究代表者 尾崎 米厚 鳥取大学医学部環境予防医学分野教授

研究要旨

2020年度は、中高生の喫煙及び飲酒行動に関する全国調査を実施予定であったが、コロナ禍の中で実施可能な調査方法を検討し、一部の中学校、高等学校を無作為に抽出して調査を実施した。また、産業職場の従業員の問題飲酒者に対する減酒支援の介入の1年後の効果判定のための調査を実施し、効果を判定するための統計学的な分析を実施した。

今回新型コロナウイルス感染症の流行下で、全国の中学校10,222校、高等学校4,248校のうち中学校48校、高等学校21校を抽出して、中高生の飲酒行動、喫煙行動、生活習慣等に関する全国調査を自宅で実施するインターネット回答方式で実施した。調査時期は2020年11月～2021年2月末であった。生徒へ調査票依頼書を配布した学校は、中学校25校（52.1%）、高等学校10校（47.6%）であった。回答した生徒数は、中学校159人（0.8%）、高等学校114人（0.6%）であり、解析を行うに値する十分な回答結果を得ることができなかった。今後は、今回開発したインターネット回答システムを用いたインターネット回答方式と紙調査回答方式を授業内で実施することを依頼し、健康日本21（第二次）の最終評価指標算出をおこなう。

減酒支援の効果の評価研究については、2019年1月から12月の期間に351名から研究参加の同意が得られた。研究参加者は各群で均等に割り付けられた。半年後の1週間当たりの飲酒量の変化において、通常版介入群で平均35.4 g/週の飲酒量の減少がみられた。一元配置分散分析において3群の平均値の差は有意であったが、多重検定を考慮すると介入効果に統計学的な有意差は示されなかった。1年後の1週間当たりの飲酒量の変化は、通常版介入群で平均29.2 g/週の減少がみられたが、3群の差は統計学的に有意ではなかった。飲酒量の変化を従属変数とした重回帰分析やロジスティック回帰分析でも半年後の減酒に通常版介入が有意な関連を示した。他に減酒と有意な関連のある説明要因は認められなかった。また、1年後の評価時期の違いによって1年後の介入効果に差が認められた。

今回の結果は、産業保健現場での保健師によるSBIが医療現場と遜色のない効果を示すという可能性を強く示唆している。また、今回効果が実証されたのは15分程度の従来通りの介入方法であった。1年後の評価で有意な介入効果が示されなかったが、1年後においても効果が持続している可能性が示された。産業保健現場での減酒支援介入の実施は、医療現場よりも若年の集団に対して予防効果が期待され、企業や地域の健康指標を改善し、アルコールによる害を減らす重要な戦略の一つとなる可能性がある。

研究分担者

兼板佳孝（日本大学医学部）、神田秀幸（島根大学医学部）、樋口進（久里浜医療センター）、井谷修（日本大学医学部）、吉本尚（筑波大学医学医療系）、金城文（鳥取大学医学部）、地家真紀（昭和女子大学生活科学部）、大塚雄一郎（日本大学医学部）、真栄里仁（久里浜医療センター）、美濃部るり子（久里浜医療センター）、桑原祐樹（鳥取大学医学部）、春日秀朗（福島県立医科大学）、伊藤央奈（郡山女子大学）

新たな実態も把握するために、全国から中学校、高等学校を無作為抽出して調査を実施した。コロナ禍で学校休校が続いたため学校での紙の調査票の記入は困難と考え、調査方法を検討することも目的に加えた。今までの全国調査の結果と今回の結果を比較し、わが国の未成年者の喫煙、飲酒行動の課題を明らかにすることを目的とした。また、前研究班で実施した成人の労働者の問題飲酒者に対する減酒支援の効果を評価するための無作為化比較試験の介入1年後の評価調査を実施した。

B. 研究方法

1) 中高生の喫煙及び飲酒行動に関する全国調査

新型コロナウイルス感染症の世界的流行下において、日本の中学校、高等学校も長い期間の休校を余儀なくされた。そのため学校での授業時間が短縮され、われわれの全国調査の回答時間を1つの講義時間を割いて実施するのは困難であるとの結論に達したので、別の方法を検討した。研

A. 研究目的

健康日本21（第2次）計画の評価のために、わが国の中高生の喫煙及び飲酒行動の実態を明らかにすることが必須である。新型たばこ（加熱式や電子）、ノンアルコール飲料、ビンジ（機会大量）飲酒、エナジードリンクのアルコール割等の

究会議、班員間の連絡を通して、新たな調査方法を検討した。

全国学校総覧を用いて対象とする中学校および高等学校を無作為に抽出した。各学校の抽出確率は在校生と数に比例して抽出確率が変化するような比例確率抽出を用いた。抽出校の校長に調査協力依頼文を送付し、協力の得られた学校から生徒経由で保護者へアンケート調査依頼書を配布してもらった。アンケート調査依頼書には、ウェブ回答画面へのURL、QRコード、調査番号、アクセスキーが示されており、保護者から調査への協力依頼の同意を得た生徒が、ウェブ画面上の保護者からの同意欄にチェックを入れ、生徒本人も同意した場合は同意欄にチェックを入れた上で、生徒自身が回答してもらった。その際、回答内容を保護者が確認しないよう、注意を促した。すべての回答が終了したのちに、謝礼を送付するメールアドレスもしくはLINEアカウントを入力した生徒には後日謝礼として、一律100円分のQUOpayを送り、抽選に当選した者に2000円分のQUOpayを送った。今回は自宅での回答ということもあります、回答率を上げるために謝礼を設けた。

2. 回答システムの開発：調査内容を研究者内で検討し、調査票を作成した。回答システムの作成は、株式会社ジール（東京）に委託した。

（倫理面への配慮）

中高生の喫煙・飲酒についての全国調査は個人情報を取得しない無記名調査である。学校名別の結果公表もしない。調査に当たっては学校長による承諾の得られた学校のみに対して実施する。研究計画は、鳥取大学医学部倫理審査委員会で審査され、承認された[承認番号：20A099]。

2) 産業保健の現場における減酒支援ブリーフインターベンションの効果検証に関する研究

鳥取県、島根県の5つの事業所に参加を呼び掛け、各事業所に努める従業員を対象とした。2019年度に同意が得られ、無作為割り付けを実施し、減酒支援を行った351人の半年後及び1年後の介入効果を検証するための調査を実施し、データ解析を行った。研究の同意者に対し、介入後半年、1年に個別の調査票を送付し、回答したもの的研究者へ返送してもらった。データを入力し、データクリーニングを実施し、不十分な回答に対しては可能な限り、本人へ問合わせを実施した。

統計分析方法としては、初めに、研究参加者のベースラインデータを集計し、各群の比較を行った。また、半年後、1年後の追跡データを用いて、各群での介入前後の週飲酒量の変化量の比較を行った。割り付けられた3群の平均の差の検定には一元配置分散分析を用いた。一元配置分散分析で3群の有意差がみられた際には多重検定を考慮してBonferroni法による有意確率P値の補正を行って、各群の差を統計学的に評価した。さらに、クロス集計を用いて、一定量飲酒量が変化したものの割合、各追跡時点での飲酒頻度、を割り付け群別に比較した。また、半年時点で40g以上飲酒量減少したもの、1年後の時点で40g以上飲酒量減少

したもの、半年・1年後時点とともに40g以上飲酒量減少したもの、半年・1年後時点とともに20g以上飲酒量減少したもの、とそうでない者で集団の基本特性にどのような違いがあるかを比較した。さらに、飲酒量の変化を従属変数とし、各説明変数を含めた重回帰分析とロジスティック回帰分析を実施することで説明変数の調整後も飲酒量の改善が認められたか、介入パターン以外に関連している要因がないかどうかを検証した。追跡中に新型コロナウイルスの流行があり、評価時期によって今回の研究対象者を2群にわけ、1年後の評価が2020年7月末までの集団と1年後の評価が2020年8月以降の集団で介入効果に違いがないかを検証した。

Intention-to-treat (ITT) 分析（脱落者の飲酒量や飲酒頻度を初回と変化なしと見なして分析）を基本とする。しかし、追加分析としてプロトコール通りに追跡できたPer protocol解析（脱落者を分析から除外）や年齢や職種で層別した集団内でのサブグループ解析を行った。

（倫理面への配慮）

本研究は鳥取大学医学部倫理審査委員会に申請し、承認を受けている（承認番号18B002）。本介入試験は大学病院医療情報ネットワーク（University Hospital Medical Information Network : UMIN）に登録されている（ID番号：UMIN 000036244）。研究助成として、厚生労働省科学研究補助金（採択番号2906081）を受け実施した。

C. 研究結果

1) 中高生の喫煙及び飲酒行動に関する全国調査

2019年12月に中国で発生した新型コロナウイルス感染症の影響により、2020年5月11日時点では国公私立86%が臨時休業し、多くの学校が5月末までの休業を継続した。そのため、当初計画していた2020年中高生調査を従来通り学校で時間を確保して実施してもらうことが難しいことが想定された。

そこで、2017年調査まで実施していた教室で調査票に記入してもらう方法からの変更を余儀なくされた。世界の類似調査でも近年、紙調査票での調査から、タブレットやパソコンを利用した調査への転換期となっており、日本においても文部科学省がGIGAスクール構想のもとに一人一台のパソコンやタブレットなどの端末を配布する方針を示しており、今後日本においても、パソコンやタブレットを用いた全国調査の実施が可能となることが示唆された。

これらの状況を踏まえ、今年度は、調査協力依頼を中高生に学校から配布してもらい、保護者の同意を得たのちに、自宅のスマートフォンやパソコンで回答してもらう方法で、2020年度全国調査を実施することを計画した。これに伴い、インターネット上で回答するための回答システムの開発もおこなった。

全国の中学校10,222校、高等学校4,248校のうち中学校48校、高等学校21校を抽出して調査を行った。調査時期は2020年11月～2021年2月末であった。学校の抽出方法は1段クラスター比

例確率抽出であった。調査対象は、抽出された学校の生徒全員である。生徒へ調査票依頼書を配布した学校は、中学校25校（52.1%）、高等学校10校（47.6%）であった。回答した生徒数は、中学校159人（0.8%）、高等学校114人（0.6%）であり、回答率は1%未満で、分析を実施できる回収数ではなかった。

2) 産業保健の現場における減酒支援ブリーフインターべンションの効果検証に関する研究

研究参加者は研究開始時点での対照群（リーフレット提供群）111名、通常版介入群128名、5分の短縮版介入群112名に割り付けられていた。半年後、1年後の追跡時に各群で脱落が生じ、最終的に対照群103名、通常版介入群122名、短縮版介入群108名が1年後までの経過を追跡することが可能であった。

初回アンケートに回答が得られた研究参加者351名の割り付け群別の各質問項目の頻度、割合を表に示す。割り付け群による各項目の差はみられず、均等に割り付けられていた。

介入半年後の効果量の群間比較

ITT分析によると、介入前の3群の週飲酒量g/週（標準偏差）は対照群260.1g/週（188.0）、通常版介入群286.2 g/週（211.4）、短縮版介入群257.4 g/週（155.6）であり、半年後では対照群273.6 g/週（205.3）、通常版介入群250.8 g/週（176.7）、短縮版介入群266.1 g/週（175.2）と通常版介入群は他の群に比べ少なかった。メインアウトカムである半年後の1週間当たりの飲酒量の変化（半年後時点の週飲酒量ひく初回の週飲酒量）では、対照群13.5 g/週（171.1）増、通常版介入群35.4 g/週（170.0）減、短縮版介入群8.6 g/週（134.6）増の変化がみられ、一元配置分散分析では3群の平均値の差は有意であった。多重検定を考慮し、有意確率をBonferroni補正した結果はp=0.057であり統計学的に有意ではなかった。

介入1年後の効果量の群間比較

ITT分析によると、1年後の1週間当たりの飲酒量の変化量（1年後時点の週飲酒量ひく初回の週飲酒量）は、対照群13.4 g/週（157.3）減、通常版介入群29.2 g/週（219.0）減、短縮版介入群5.9 g/週（157.9）増の変化がみられた。一元配置分散分析で3群の平均値の差を検定したが、p=0.332と統計学的に有意ではなかった。

割り付け群別の飲酒量変化者の割合

いずれの項目においても通常版介入群で飲酒量の減少を認めた者の割合が多く、次いで短縮版介入群、対照群であった。通常版介入群では、半年時点での40g/週以上減酒したものが4割、一年時点でも4割、20g/週の減酒を認めた者は5割近くに上った。いずれも40g/週減少が33.6%、20g/週減少が40.6%であった。

割り付け群別の飲酒頻度の変化

週に5日以上飲酒するものの割合は通常版介入群で経過とともに減少を認めた。短縮版介入群では半年時点での割合が減ったが、一年時点では再び増え、対照群では半年後増えて、一年時点では急な減少がみられた。週3日以上飲酒するものの割合も同じような傾向がみられた。30日以内機会大量飲酒するものの割合はいずれの群でも半年、一年

と経時的に減少傾向を認めた。

飲酒量が減少したものの特性

いずれの指標をアウトカムと見なして分析した場合でも、通常版介入群では減酒したものの割合が高かった。年代においては一貫性がみられず、婚姻状況も既婚と未婚で大きな差はなかった。年収で600万円未満と回答したもの、仕事の種類が事務職、K6の質問項目で高得点13点以上（高度の不安やうつがみられる）で、いずれのアウトカムにおいても減酒したものの割合が高かった。運動量の多いものは減酒したものの割合が低い傾向がみられた。

減酒ありを従属変数としたロジスティック回帰分析

半年後飲酒量40g/週減少を従属変数とすると、各説明変数を調整後も通常版介入群であることは、飲酒量の減少に有意な関係を認めた（OR 1.92, 95%CI: 1.03, 3.56）。他の変数で半年後の減酒に有意な関連がみられる項目はなかった。1年後の飲酒量40g/週減少を従属変数とすると、介入パターンに加えいずれの説明変数も有意な関連は見られなかった。さらに、半年後と1年後がともに飲酒量40g/週減少を従属変数とすると、通常版介入群で有意な関連がみられ（OR 2.44, 95%CI: 1.22, 4.90）、半年後と1年後がともに飲酒量20g/週減少を従属変数とした分析でも通常版介入群であることは統計学的に有意に飲酒量減少の有無と関連がみられた（OR 2.11, 95%CI: 1.11, 4.01）。

追跡後の評価時期による層別分析

1年後の評価が2020年7月末までの集団において、1年後の飲酒量40g/週減少を従属変数としたロジスティック回帰分析では、介入パターンと減酒ありに有意な関連がみられた。（短縮版でOR 2.73, 95%CI: 1.02, 7.30、通常版でOR 3.44, 95%CI: 1.33, 8.86）。一方で、1年後の評価が2020年8月以降の集団でのロジスティック回帰分析では、介入パターンの違いは有意な関連を示さなかった。

D. 考察

1) 中高生の喫煙及び飲酒行動に関する全国調査

今回新型コロナウイルス感染症の流行下で、中高生の飲酒行動、喫煙行動、生活習慣等に関する全国調査を、自宅で実施するインターネット回答方式で実施したが、解析を行うに値する十分な回答結果を得ることができなかった。

自宅で実施するインターネット回答方式の場合、学校で生徒へ調査依頼書類を配布してくれるか、配布した書類を元に生徒が回答してくれるか、の2段階の障壁があった。学校が依頼書類を配布してくれるか、については、今回中学校25校（52.1%）、高等学校10校（47.6%）が配布しており、2017年全国調査において学校での実施率が中学校49%、高等学校64%であったことと比較すると、ほぼ同程度配布してくれたと考えられる。新型コロナウイルス流行下で大変な状況の中、配布するだけであれば、比較的の学校には協力をもらえると考えられた。一方、配布した書類を元に生徒が回答してくれるか、については、学校側が協力

してくれた学校においても、非常に難しいことが明らかであった。自宅で回答する動機づけに、Q UOpayによる謝札を用意したが、回答率を上げる効果は乏しかった。以上を踏まえると、自宅で実施するインターネット回答方式は今後も困難であることが容易に推測される。回答を拒否する権利があることを説明したうえで、従来と同様、授業内で回答してもらうことが必要である。

今回の結果を踏まえ、今後は、今回開発したインターネット回答方式が、紙調査票回答方式と比較して同等の結果が得られることの確認、授業内での調査の実施をおこなっていくことが必要である。2021年度の健康日本21（第2次）の最終評価指標を算出するためにも、中高生の飲酒や喫煙の実態を把握するためにも、2021年度に授業内の全国調査実施を進めていく。

2) 産業保健の現場における減酒支援ブリーフィンターベンションの効果検証に関する研究

今回の研究は、日本における初めてのスクリーニングを伴った、産業保健現場における比較的大規模な減酒支援の効果検証のための研究である。無作為割り付けを行った380名のうち351名から研究参加の同意が得られた。各群の基本属性を比較すると、対象者は3群に均等に割り付けられており、年齢は40から50歳代が中心で、ほとんどは男性で、8割以上が週3日以上飲酒し、7割以上が30日以内に機会大量飲酒を経験していた。

主要評価項目である半年後の1週間当たりの飲酒量の変化の群間比較では、通常版介入群において35.4 g/週の飲酒量の減少がみられた。1年後の1週間当たりの飲酒量の変化は、通常版介入群で29.2 g/週の減少がみられたが、対照群でも飲酒量の減少がみられ、3群の平均値の差は統計学的に有意ではなかった。統計学的に有意でなかったものの、通常版介入群の飲酒量は初回と比較して減少しており、1年後の時点でも効果が持続している可能性を示している。飲酒頻度の多い者、機会大量飲酒の者の割合は、研究参加者全体で減少を認め、特に通常版介入群では順調に低下した。

飲酒量の変化に関する要因を探索する目的で行った重回帰分析の結果、半年後の飲酒量の変化には通常版介入群が有意な関連を示した。しかし、1年後の飲酒量の変化には有意な関連がみられなかった。同様に、減酒をアウトカムとしたロジスティック回帰分析では、通常版介入群であることは、半年後減酒、半年後と1年後ともに減酒といったアウトカムと有意な関連がみられた。オッズ比を参考にすると、通常版介入群では対照群に比べ約2倍減酒の結果がみられやすいことを示しており、今回の介入効果を支持する結果である。

さらに、1年後の分析では、介入の効果が示されず、対照群において1年後の時点で不自然な飲酒量や飲酒頻度の減少を認めていた。2020年6月頃から新型コロナウイルス流行の波が起り、都市閉鎖や外出自粛が叫ばれ、島根県では感染者数が少なかったものの、行政機関は外食利用などを控えるよう住民に要請していた。そのため、1年後の評価時期による介入効果の違いが考えられた。評価時期の違いによる層別のロジスティック回帰分析の結果を見ると、2020年7月末までの群では関連要因の調整後も通常版介入群、短縮版介入群であることは有意に減酒と関連していた。1年後

の評価が8月以降の群では、介入群であることには有意な関連がみられなかった。このことは、新型コロナウイルス流行により、飲み会が減ったり、仕事のペースが変わったことにより対象者全体に飲酒行動の変化が起こった可能性がある。こうした影響が、1年後の介入効果が十分に出なかつた原因であるかもしれない。8月以降に1年後の評価を行つた群において、年齢が50歳以上であることと、年収が600万円未満であることが減酒と関連していたことを鑑みると、新型コロナウイルス流行における社会の変化の影響を受けやすい集団の特性を表している可能性がある。

E. 結論

今回新型コロナウイルス感染症の流行下で、中高生の飲酒行動、喫煙行動、生活習慣等に関する全国調査を、自宅で実施するインターネット回答方式で実施したが、解析を行うに値する十分な回答結果を得ることができなかつた。今後はインターネット回答方式と紙調査回答方式を授業内で実施し、健康日本21（第二次）の最終評価指標算出をおこなう。

今回の研究結果では、サンプルサイズの不足により有意差は示せなかつたが、産業保健現場での保健師によるスクリーニングの後の減酒支援が医療現場と遜色のない一定の効果を示すという可能性を強く示唆している。また、今回効果が実証されたのは15分程度の従来通りの介入方法であった。1年後の評価には新型コロナウイルス流行の影響も考えられ、十分な介入効果が示されなかつたが、1年後においても一定の効果が持続している可能性が示された。

産業保健現場でのスクリーニングの後の減酒支援（SBI）の実施は、プライマリケアなどの医療現場よりも若年の集団に対して予防効果が期待され、企業や地域の健康指標を改善し、アルコールによる害を減らす重要な戦略の一つとなる可能性がある。将来的には、介入方法の改善、現場での実現可能性の検証、健診結果を介入の評価項目とした介入効果の根拠を示すことで、SBI実践の場を広げ、アルコールによる疾病負荷の軽減に貢献したいと考える。

研究要旨

今回新型コロナウイルス感染症の流行下で、全国の中学校 10,222 校、高等学校 4,248 校のうち中学校 48 校、高等学校 21 校を抽出して、中高生の飲酒行動、喫煙行動、生活習慣等に関する全国調査を自宅で実施するインターネット回答方式で実施した。調査時期は 2020 年 11 月～2021 年 2 月末であった。生徒へ調査票依頼書を配布した学校は、中学校 25 校 (52.1%)、高等学校 10 校 (47.6%) であった。回答した生徒数は、中学校 159 人 (0.8%)、高等学校 114 人 (0.6%) であり、解析を行うに値する十分な回答結果を得ることができなかった。今後は、今回開発したインターネット回答システムを用いたインターネット回答方式と紙調査回答方式を授業内で実施することを依頼し、健康日本 21（第二次）の最終評価指標算出をおこなう。

研究協力者：藤井麻耶（鳥取大学医学部環境予防医学分野）

A. 研究目的

健康日本 21（第 2 次）では、未成年の喫煙率や飲酒率を 0 にするという目標があり、その評価指標である中 1 と高 3 の喫煙率、中 3 と高 3 の飲酒率は、中高生の生活習慣に関する全国調査から算出されてきた。本研究班では、これまで 1996 年、2000 年、2004 年、2007 年、2008 年、2010 年、2012 年、2014 年、2017 年の全国調査を実施してきた[1] -[17]。2021 年度は健康日本 21（第 2 次）の最終評価が行われる予定であり、最終評価に活用する評価指標を算出する

ため、また、わが国の中高生の生活習慣の改善について提言するためにも、最新の実態を把握することは必須であり、これまでの経験をもとに 2020 年度の全国調査を計画した。

B. 研究方法

1. 全国調査実施方法：

全国学校総覧を用いて対象とする中学校および高等学校を無作為に抽出した。各学校の抽出確率は在校生と数に比例して抽出確率が変化するような比例確率抽出を用いた。抽出校の校長に調査協力依頼文を送付し、協力の得られた学校から生徒経由で保護者へアンケート調査依頼書を配布してもらった。アンケート調査依頼書

には、ウェブ回答画面への URL、QR コード、調査番号、アクセスキーが示されており、保護者から調査への協力依頼の同意を得た生徒が、ウェブ画面上の保護者からの同意欄にチェックを入れ、生徒本人も同意した場合は同意欄にチェックを入れた上で、生徒自身が回答してもらった。その際、回答内容を保護者が確認しないよう、注意を促した。すべての回答が終了したのちに、謝礼を送付するメールアドレスもしくは LINE アカウントを入力した生徒には後日謝礼として、一律 100 円分の QUOpay を送り、抽選に当選した者に 2000 円分の QUOpay を送った。今回は自宅での回答ということもあり、回答率を上げるために謝礼を設けた。

2. 回答システムの開発：調査内容を研究者内で検討し、調査票を作成した。回答システムの作成は、株式会社ジール（東京）に委託した。

（倫理面への配慮）

中高生の喫煙・飲酒についての全国調査は個人情報を取得しない無記名調査である。学校名別の結果公表もしない。調査に当たっては学校長による承諾の得られた学校のみに対して実施する。研究計画は、鳥取大学医学部倫理審査委員会で審査され、承認された[承認番号：20A099]。

C. 研究結果

2019 年 12 月に中国で発生した新型コロナウイルス感染症の影響により、2020 年 5 月 11 日時点では国公私立 86% が臨時休業し、多くの学校が 5 月末までの休業を継続した[18]。学校再開に向けて学校再開ガイドラインが作成され、学校側は感染対策の徹底が求められ、学校再開後も、授業の二部制の導入、授業時間の確保、感染対策の実施など、学校側の負担が大きい状況が続いた[19]。そのため、当初計画していた 2020 年中高生調査を従来通り学校で時間を確保して実施してもらうことが難しいことが想定さ

れた。

そこで、2017 年調査まで実施していた教室内で調査票に記入してもらう方法からの変更を余儀なくされた。各国の青少年のリスク行動に関する調査をもとに、方法を検討した。米国の Monitoring the Future (MTF) は、8th grade、10th grade、12th grade を対象としたアルコールやタバコ、大麻その他の薬物利用の実態を把握するための school-based survey である[20]。また、The European School Survey Project on Alcohol and Other Drugs (ESPAD) はヨーロッパ諸国の青少年のアルコールや薬物使用を把握するための school-based survey である[21]。これらの調査においても、近年、紙調査票での調査から、タブレットやパソコンを利用した調査への転換期となっており、MTF では、2019 年に紙調査票とタブレット調査を併用して調査を実施している。また、日本においても文部科学省が GIGA スクール構想のもとに一人一台のパソコンやタブレットなどの端末を配布する方針を示しており、今後日本においても、パソコンやタブレットを用いた全国調査の実施が可能となることが示唆された[22]。

これらの状況を踏まえ、今年度は、調査協力依頼を中高生に学校から配布してもらい、保護者の同意を得たのちに、自宅のスマートフォンやパソコンで回答してもらう方法で、2020 年度全国調査を実施することを計画した。これに伴い、インターネット上で回答するための回答システムの開発もおこなった。

全国の中学校 10,222 校、高等学校 4,248 校のうち中学校 48 校、高等学校 21 校を抽出して調査を行った。調査時期は 2020 年 11 月～2021 年 2 月末であった。学校の抽出方法は 1 段クラスター比例確率抽出であった。調査対象は、抽出された学校の生徒全員である。生徒へ調査票依頼書を配布した学校は、中学校 25 校 (52.1%)、高等学校 10 校 (47.6%) であった。回答した生徒数は、中学校 159 人 (0.8%)、高等学校 114 人 (0.6%) であり、回答率は 1% 未満で、分析を実

施できる回収数ではなかった。

D. 考察

今回新型コロナウイルス感染症の流行下で、中高生の飲酒行動、喫煙行動、生活習慣等に関する全国調査を、自宅で実施するインターネット回答方式で実施したが、解析を行うに値する十分な回答結果を得ることができなかつた。

自宅で実施するインターネット回答方式の場合、学校で生徒へ調査依頼書類を配布してくれるか、配布した書類を元に生徒が回答してくれるか、の2段階の障壁があつた。学校が依頼書類を配布してくれるか、については、今回中学校25校(52.1%)、高等学校10校(47.6%)が配布しており、2017年全国調査において学校での実施率が中学校49%、高等学校64%であったことと比較すると、ほぼ同程度配布してくれたと考えられる。新型コロナウイルス流行下で大変な状況の中、配布するだけであれば、比較的学校には協力をしてもらえると考えられた。一方、配布した書類を元に生徒が回答してくれるか、については、学校側が協力をしてくれた学校においても、非常に難しいことが明らかであつた。自宅で回答する動機づけに、QUOpayによる謝礼を用意したが、回答率を上げる効果は乏しかつた。以上を踏まえると、自宅で実施するインターネット回答方式は今後も困難であることが容易に推測される。回答を拒否する権利があることを説明したうえで、従来と同様、授業内で回答してもらうことが必要である。

米国のMTFにおいても、2019年までは40,000人を超える回答者数であったが、2020年は10,000人程度の回答となっており、新型コロナウイルス感染症の流行により、2019年までの調査と比較可能性が乏しいことが報告されている[23]。2020年の新型コロナウイルス感染症流行下においては、教室で実施していたとしても、おそらく学校が授業時間内に回答を実施することの協力を得られることができなかつたと推測される。

今回の結果を踏まえ、今後は、今回開発したインターネット回答方式が、紙調査票回答方式と比較して同等の結果が得られることの確認、授業内での調査の実施をおこなっていくことが必要である。2021年度の健康日本21(第2次)の最終評価指標を算出するためにも、中高生の飲酒や喫煙の実態を把握するためにも、2021年度に授業内での全国調査実施を進めていく。

E. 結論

今回新型コロナウイルス感染症の流行下で、中高生の飲酒行動、喫煙行動、生活習慣等に関する全国調査を、自宅で実施するインターネット回答方式で実施したが、解析を行うに値する十分な回答結果を得ることができなかつた。今後はインターネット回答方式と紙調査回答方式を授業内で実施し、健康日本21(第二次)の最終評価指標算出をおこなう。

中高生の生活習慣に関する全国調査（2020 年版）

中学、高校生の生活習慣は、健康と関係があるため厚生労働省がすすめている健康づくり計画である健康日本21(第2次)にも取り上げられています。中学、高校生の生活習慣についての全国調査は1996年から今までに9度行われています。このたび2017年以降にどのように変化したかを知るために全国の中学校、高等学校からくじ引きで合計数百校を選んで全校生徒に対するアンケート調査を実施することになりました。この調査は未成年者の飲酒やタバコ使用の様子を明らかにするなど、国が健康についての対策を考えるために大変重要な資料になります。この調査は、回答した人に不利益がおよぶようなものでなく、みなさんの健康を守るために使われる大切なものですのでぜひ協力してください。

このアンケートは、個人の秘密を守るために、書いた人が誰かわかるような「名前」等の項目はありません。回答はほとんどが当てはまる項目を選ぶだけです。学校の先生や保護者にもどんな回答をしたかわかりません。回答したデータは集計する大学に送られ、その結果は集計表をつくるためだけに使用し、研究以外の目的には利用しません。回答はありのままを正直に答えてください。

なお、このアンケートの質問文にあるお酒とは日本酒のことではなくビール、日本酒、焼酎、ワイン、ジン、ウイスキー、ブランディー、ウォッカといったアルコール類をまとめた表現だと思ってください。

厚生労働省 飲酒や喫煙等の実態調査と生活習慣病予防のための減酒の効果的な介入法の開発に関する研究グループ
研究代表者 尾崎米厚（鳥取大学医学部 環境予防医学分野 教授）

※ご協力いただける場合は、□に○をつけてください。

回答はすべて統計的に処理し、プライバシーは保護されます。

また、個人の回答が学校を含めた第三者に知らされることはありません。

すべてのアンケートにご協力いただき、メールアドレスを入力するか LINE で友だちになると、アンケート回答の謝礼としてコンビニ等で使える QUOpay（クオ・ペイ）100 円分をメールまたは LINE アカウントにお送りします。

保護者同意欄

このアンケートに協力することに同意します。

本人同意欄

このアンケートに協力することに同意します。

ここから先のアンケートは、生徒であるご本人がお答えください。

(質問 1) あなたは男性ですか、女性ですか？あてはまる数字に○をつけてください。

1. 男性 2. 女性 (10)

(質問 2) あなたの学年は何年生ですか？あてはまる数字に○をつけてください。

1. 1 年生 2. 2 年生 3. 3 年生 (11)

(質問 3) あなたの年齢に○をつけてください。

- | | | | | |
|---------|---------|---------|-----------|------|
| 1. 12 才 | 3. 14 才 | 5. 16 才 | 7. 18 才 | (12) |
| 2. 13 才 | 4. 15 才 | 6. 17 才 | 8. 19 才以上 | |

(質問 4) あなたはお酒をどのくらいの頻度で飲みますか？あてはまる数字に 1 つ○をつけてください。

(このアンケートの質問文にあるお酒とは日本酒のことではなくビール、日本酒、焼酎、ワイン、ジン、ウイスキー、ブランディー、ウォッカといったアルコール類をまとめた表現だと思ってください。以下も同じです)

- | | | | |
|-------------|-------------|---------|------|
| 1. 飲まない | 3. 月に 1、2 回 | 5. 週に数回 | (13) |
| 2. 年に 1、2 回 | 4. 週末ごとに | 6. 毎日 | |

(質問 5) この30日間に、少しでもお酒を飲んだ日は合計何日になりますか？

- | | | | | |
|---------|---------|-----------|------------|------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 毎日（30日） | (14) |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | | |

(質問6) あなたは以下のような時にお酒を飲んだことがありますか？あてはまるものをいくつでも○をつけてください。

1. 飲んだことがない
2. 冠婚葬祭（結婚式、お祭り、葬式、法事、お盆、正月など）の時に飲んだことがある
3. 家族が食事の時にお酒を飲む時にいっしょに飲んだことがある
4. クラス会、打ち上げ、コンパの時に飲んだことがある
5. 居酒屋、カラオケボックス、飲み屋などで仲間といっしょに飲んだことがある
6. 誰かの部屋で仲間といっしょに飲んだことがある
7. ひとりで飲んだことがある

(15)

(質問7) お酒を飲む時にはどのくらいの量を飲みますか？

- | | |
|---------------------|-------------|
| 1. 飲まない | 5. コップに3～5杯 |
| 2. コップ1杯未満（ほんの少しの量） | 6. コップに6杯以上 |
| 3. コップに1杯 | 7. 酔いつぶれるまで |
| 4. コップに2杯 | |

(16)

(質問8) あなたはお酒を飲む時に、たくさん飲むことがどのくらいの頻度ありますか？

（「たくさん」とはビール・甘いお酒サワーだと通常のカン（350ml）で「5本以上」のことです）

- | | | |
|-----------|-----------|-----------|
| 1. 飲まない | 3. 年に数回 | 5. 週に1、2回 |
| 2. 年に1回以下 | 4. 月に1、2回 | 6. 週に3回以上 |

(17)

(質問9) 自分からすすんでまたはお酒とわかって初めてお酒を飲んだのは何才ころですか？

- | | | | |
|----------------|-----------|-----------|------------|
| 1. 一度も飲んだことがない | 3. 9か10才 | 5. 13か14才 | 7. 17才よりうえ |
| 2. 8才かそれより若く | 4. 11か12才 | 6. 15か16才 | |

(18)

(質問10) 初めて友だちや仲間とお酒を飲んだのは何才ころですか？

- | | | | |
|----------------|-----------|-----------|------------|
| 1. 一度も飲んだことがない | 3. 9か10才 | 5. 13か14才 | 7. 17才よりうえ |
| 2. 8才かそれより若く | 4. 11か12才 | 6. 15か16才 | |

(19)

(質問11) よく飲むお酒はどんな種類ですか？あてはまるものをいくつでも○をつけてください。

- | | |
|---------|-----------------------------|
| 1. 飲まない | 5. 焼酎、サワー類 |
| 2. ビール | 6. アルコール度が低く甘いお酒（果実酒など） |
| 3. 日本酒 | 7. ウイスキー、ブランディー、ウォッカなどの強いお酒 |
| 4. ワイン | |

(20)

(質問12) この30日間に、アルコールの入っていない（ノンアルコール、アルコールフリー、アルコールゼロ）ビール、カクテル、酎ハイ飲料を飲んだ日は合計何日になりますか？

- | | | | |
|---------|---------|-----------|------------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 毎日（30日） |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | |

(14)

(質問13) この30日間に、何日、エナジードリンク（モンスター、モンスターエナジー、レッドブル、コカ・コーラエナジー、ゾーン（ZONe）など）を飲んだ日は合計何日になりますか？

- | | | | |
|---------|---------|-----------|------------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 毎日（30日） |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | |

(14)

(質問14) お酒をエナジードリンクと混ぜて飲むことがどのくらいの頻度ありますか？

- | | | |
|-----------|-----------|-----------|
| 1. 飲まない | 3. 年に数回 | 5. 週に1、2回 |
| 2. 年に1回以下 | 4. 月に1、2回 | 6. 週に3回以上 |

(17)

(質問15) お酒を主にどうやって手に入っていますか？ あてはまるものをいくつでも○をつけてください。

- | | |
|----------------|----------------------------|
| 1. 一度も飲んだことがない | 5. 自動販売機で買う |
| 2. 家にあるお酒を飲む | 6. 居酒屋、カラオケボックス、飲み屋などで飲む |
| 3. 友だちや知人からもらう | 7. コンビニエンスストア、スーパーマーケットで買う |
| 4. 酒屋で買う | 8. その他の方法で |

□

(質問16) あなたは、この30日間に年齢のためにお酒を売ってもらえないかったことがありますか？

- | | | |
|----------------|------------------|----------------|
| 1. この間、買おうとしたが | 2. 時々売ってもらえないかった | 3. いつでも売ってもらえた |
|----------------|------------------|----------------|

□

(質問17) あなたは、お父さんかお母さんにお酒を飲むのをすすめられたことがありますか？

1. はい

2. いいえ

3. おぼえていない

□

(質問18) あなたは、親がお酒を飲むのを嫌だと思ったことがありますか？

1. ある

2. ない

3. 親はお酒を飲まない

□

(質問19) あなたは、未成年者の飲酒禁止をどう思いますか？自分の気持ちに近いもの1つに○をつけてください。

1. 当然だと思う

3. 成人が飲めて、未成年者が飲めないのはおかしいと思う

2. しかたないことだと思う

4. 法律で決める必要はなく、個人の好きにさせればよいと思う

□

(質問20) お酒を飲むと身体に害があると思いますか？1つを選んで○をつけてください。

1. かえって健康によいと思う

4. 害があると思う

2. 体に良くも悪くもないと思う

5. わからない

3. 少少はあるだろうが、たいしたことはないと思う

□

(質問21) お酒を飲んで失敗したことがありますか？いくつでも選んで○をつけてください。

1. お酒を飲んだことがない

5. 事故やケンカなどで警察につかまった

2. 酔って（よって）はいた

6. 親にしかられた

3. 酔ってケンカをした

7. けがをした

4. 酔って記憶がなくなった

8. 一度も失敗したことがない

□

(質問22) お酒を飲むことには次のどのような病気やできごとと関係があると思いますか。あてはまるものにいくつでも○をつけてください。

1. 肺がんがおこる

2. 急性アルコール中毒になる

3. 肝ぞうが悪くなる

4. 交通事故が増える

5. 生まれてくる赤ちゃんの障害

6. インフルエンザが起こる

7. アルコール依存症になる

8. 脳がちぢむ

(質問23) あなたは、お酒を飲んだ人からイヤだと思うことをされたことがありますか？いくつでも選んで○をつけてください。

1. イヤだと思うことはされたことがない

4. 体をさわられそうになった・さわられた

2. イヤなことを言われた・からまれた

5. 暴力を受けそうになった・受けた

3. お酒を飲まされそうになった・飲まされた

6. その他（ ）

□

(質問24) また、どこで、お酒を飲んだ人からイヤだと思うことをされましたか？

1. イヤだと思うことはされたことがない

3. 自分以外の人の家

5. アルバイト先

2. 自分の家

4. 食事に行った飲食店

6. その他

□

(質問25) この30日間で、あなたはお酒の広告(コマーシャル、CM)をどこで見かけましたか？あてはまるものをいくつでも○をつけてください。

1. ウェブサイトや動画サイト

2. テレビ

3. コンビニエンスストアやスーパーなどの店に貼ってあるポスター

4. 駅や電車・バスの中

5. まったく見なかった、見たがどこかわからない

ここからはタバコについての質問です。

※これらの質問では、「紙巻タバコ」、「加熱式タバコ」、「電子タバコ」「新型タバコ（加熱式タバコもしくは電子タバコ）」、「タバコ（これらすべてを含む）」を区別して尋ねます。
回答の際に注意してください。

(質問26) あなたは、今までに紙巻きタバコ（紙を巻いたぼうの形をしたもので、火をつけて吸う普通のタバコ）を一口でも吸ったことがありますか？

1. ない

2. ある

□

(質問27) あなたが紙巻きタバコを初めて吸ったのは何才ころですか？1つだけ選んで数字に○をつけてください。

1. 吸ったことがない

4. 9才

7. 12才

10. 15才

13. 18才以上

2. 7才以下

5. 10才

8. 13才

11. 16才

□

3. 8才

6. 11才

9. 14才

12. 17才

(質問28) あなたが新型タバコ（加熱式タバコもしくは電子タバコ）を初めて吸ったのは何才ころですか？
1つだけ選んで数字に○をつけてください。

1. 吸ったことがない
2. 7才以下
3. 8才

4. 9才
5. 10才
6. 11才

7. 12才
8. 13才
9. 14才

10. 15才
11. 16才
12. 17才

13. 18才以上

(質問29) この30日間に、何日、紙巻きタバコを吸いましたか？

1. 0日
2. 1か2日

3. 3～5日
4. 6～9日

5. 10～19日
6. 20～29日

7. 毎日（30日）

(質問30) この30日間に、1日平均どのくらいの本数の紙巻きタバコを吸いましたか？

1. この間、吸っていない
2. 1日1本に満たない
3. 1本

4. 2～5本
5. 6～10本
6. 11～15本

7. 16～20本
8. 21本以上

(質問31) この30日間に、自分の吸う紙巻きタバコをおもにどのようにして手に入りましたか？
あてはまるものにいくつでも○をつけてください。

1. この間、吸っていない
2. コンビニエンスストア、スーパー・マーケット、ガソリンスタンド等の店で買った
3. 自動販売機で買った
4. タバコ屋で買った
5. 誰からもらった
6. 家にあるタバコを吸った
7. インターネットで買った
8. その他の方法で

(質問32) あなたは、今までに加熱式タバコを一口でも吸ったことがありますか？（加熱式たばことは、（加熱式たばことは、アイコス(iQOS)、グロー(glo)、プルームテック(Ploom TECH)、パルズ(PULZE)などの商品です））

1. な い 2. あ る

(質問33) この30日間に、何日、加熱式タバコを吸いましたか？

1. 0日
2. 1か2日

3. 3～5日
4. 6～9日

5. 10～19日
6. 20～29日

7. 每日（30日）

(質問34) あなたは、今までに電子タバコを一口でも吸ったことがありますか？（電子タバコとは、マイブルー(myblu)、ドクターベイプ(DR.VAPE)、イーゴ(eGO AIO)、ゼロスティック(ZERO STICK)、ベポレッソ(VAPORESSO OSMALL)などの商品のことです）

1. な い 2. あ る

(質問35) この30日間に、何日、電子タバコを吸いましたか？

1. 0日
2. 1か2日

3. 3～5日
4. 6～9日

5. 10～19日
6. 20～29日

7. 每日（30日）

(質問36) この30日間に、自分の吸う加熱式タバコや電子タバコをおもにどのようにして手に入りましたか？あてはまるものにいくつでも○をつけてください。

1. この間、吸っていない
2. コンビニエンスストア、スーパー・マーケット、ガソリンスタンド等の店で買った
3. 自動販売機で買った
4. タバコ屋または新型タバコ販売店で買った
5. 誰からもらった
6. 家にあるタバコを吸った
7. インターネットで買った
8. その他の方法で

(質問37) あなたが現在吸っているタバコの銘柄の名前（商品名）を略さず1つだけ書いてください。吸っていない人は書かないでください（加熱式タバコや電子タバコを含めあらゆるタバコのうち最もよく吸った商品の名前です）。

(

)

□～□

(質問38) 紙巻タバコは買いたくなかったと思いますか？その理由を、いくつでも○をつけてください。

- | | |
|------------------------|--------------------|
| 1. タバコを吸った（買った）ことがない | 6. タバコの値段が高くなかった |
| 2. 買いたくなかったとは思わない | 7. タバコを吸える場所が減った |
| 3. 年齢確認が厳しくなった | 8. 周りの目が気になるようになった |
| 4. 自販機が使えなくなった（タスボが必要） | 9. その他（ ） |
| 5. 家にタバコがなくなった | |

□

(質問39) あなたは紙巻タバコをやめたいと思いますか？1つだけ選んで数字に○をつけてください。

- | | |
|-----------------------|-------------|
| 1. タバコを吸っていない | 4. 本数を減らしたい |
| 2. 実際、やめようと取り組んだことがある | 5. やめたくない |
| 3. やめたいと思う | 6. わからない |

□

(質問40) あなたはこの30日間に年齢のために紙巻タバコまたは加熱式タバコを売ってもらえなかったことがありますか？

- | | |
|------------------|-----------------------------|
| 1. この間、買おうとしなかった | 3. いつでも売ってもらえた（年齢はごまかした） |
| 2. 時々売ってもらえなかった | 4. いつでも売ってもらえた（年齢はごまかしていない） |

□

(質問41) あなたはこの30日間に年齢のために電子タバコを売ってもらえなかったことがありますか？

- | | |
|------------------|-----------------------------|
| 1. この間、買おうとしなかった | 3. いつでも売ってもらえた（年齢はごまかした） |
| 2. 時々売ってもらえなかった | 4. いつでも売ってもらえた（年齢はごまかしていない） |

□

(質問42) あなたは、親が紙巻タバコを吸うのを嫌だと思ったことがありますか？

- | | | |
|-------|-------|---------------|
| 1. ある | 2. ない | 3. 親はタバコを吸わない |
|-------|-------|---------------|

□

(質問43) あなたの親や兄弟、友だちは禁煙に取り組んでいますか？あてはまるものにいくつでも○をつけてください。

- | | |
|---------------------------|------------------|
| 1. 周りにタバコを吸う人・禁煙している人はいない | 4. 友だちが禁煙している |
| 2. 親が禁煙している（電子たばこを使わずに） | 5. 親が電子たばこを使っている |
| 3. 兄弟が禁煙している | |

□

(質問44) 朝起きて、すぐにタバコを吸うか、タバコを吸いたいと思ったことはありますか？

- | | |
|-------------------|----------------------|
| 1. タバコを吸ったことがない | 4. ときどき朝吸ったり、吸いたいと思う |
| 2. 今はタバコを吸っていない | 5. いつも朝吸ったり、吸いたいと思う |
| 3. 朝吸いたいと思ったことはない | |

□

(質問45) タバコを吸うと身体に害があると思いますか？1つを選んで○をつけてください。

- | | |
|----------------------------|------------|
| 1. 害があるとは思わない | 3. 害があると思う |
| 2. 少少はあるだろうが、たいしたことではないと思う | 4. わからない |

□

(質問46) 他人の紙巻タバコからの煙はあなたにとって有害であると思いますか？

- | | | | |
|-----------|---------------|-------------|---------|
| 1. そう思わない | 2. おそらくそう思わない | 3. おそらくそう思う | 4. そう思う |
|-----------|---------------|-------------|---------|

□

(質問47) 他人の加熱式タバコからの煙はあなたにとって有害であると思いますか？

- | | | | |
|-----------|---------------|-------------|---------|
| 1. そう思わない | 2. おそらくそう思わない | 3. おそらくそう思う | 4. そう思う |
|-----------|---------------|-------------|---------|

□

(質問48) この7日間のうちで、家で、あなたのいるところで、誰かが紙巻タバコを吸ったのは何日間になりますか？

- | | | |
|----------|----------|-------|
| 1. 0日 | 3. 3から4日 | 5. 7日 |
| 2. 1から2日 | 4. 5から6日 | |

□

(質問49) この7日間のうちで、家以外の場所で、あなたのいるところで、誰かが紙巻タバコを吸ったのは何日間になりますか？

- | | | |
|----------|----------|-------|
| 1. 0日 | 3. 3から4日 | 5. 7日 |
| 2. 1から2日 | 4. 5から6日 | |

□

(質問50) この30日間で、あなたは加熱式タバコの広告や宣伝をどこで見ましたか？あてはまるものをいくつでも○をつけてください。（ここでいうタバコ広告とは、製品の宣伝広告だけであり、喫煙マナー やタバコ会社のイメージの広告やキャッチコピー（たとえばＪＴなら「ひとのときを想う」、「ひろえば街が好きになる運動」、「ひとつずつですが、未来へ」等）が入ったものは含みません。）

1. ウェブサイトや動画サイト

3. 駅や電車・バスの中
4. まったく見なかった、見たがどこかわからない

あなたの、生活についてお聞きします。

(質問51) あなたは、朝食を毎日食べますか？

- | | | |
|-----------------------|----------|-------------|
| 月～金：1. ほとんど毎日食べている | 2. 時々食べる | 3. ほとんど食べない |
| 土・日・祝日：1. ほとんど毎日食べている | 2. 時々食べる | 3. ほとんど食べない |

(質問52) あなたは、家の食事で1週間に野菜をどのくらい食べていますか？

1. 必ず毎日
2. 週4～5日
3. 週2～3日
4. ほとんど食べない

(質問53) あなたは、インスタントラーメンやカップめんをどのくらい食べていますか？

1. 週3回より多い
2. 週1～2回
3. 月1～3日回
4. 月1回より少ない

□

(質問54) あなたはクラブ活動に参加していますか？

1. 積極的に参加している
2. 積極的でないが参加している
3. 参加していない

□

(質問 55) この30日間に、体育の授業以外で、30分以上体を動かす運動やスポーツをした日が何日ありましたか？

- | | | | |
|---------|---------|-----------|------------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 毎日（30日） |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | |

(質問 56) この30日間に、体育の授業以外で、1日平均どのくらいの時間、体を動かす運動やスポーツを行いましたか？

- | | | |
|--------------|------------|------------|
| 1. まったくしなかった | 3. 1～2時間未満 | 5. 3～5時間未満 |
| 2. 1時間未満 | 4. 2～3時間未満 | 6. 5時間以上 |

(質問57) この30日間に、1日平均どのくらいの時間、学校の授業をオンラインで受けましたか？

- | | | |
|--------------|------------|------------|
| 1. まったくしなかった | 3. 1～2時間未満 | 5. 3～5時間未満 |
| 2. 1時間未満 | 4. 2～3時間未満 | 6. 5時間以上 |

(質問 58) この30日間に、1日平均どのくらいの時間、学校以外の授業をオンラインで受けましたか？

- | | | |
|--------------|------------|------------|
| 1. まったくしなかった | 3. 1～2時間未満 | 5. 3～5時間未満 |
| 2. 1時間未満 | 4. 2～3時間未満 | 6. 5時間以上 |

(質問59) 学校は楽しいですか？

1. 楽しい
2. どちらとも言えない
3. 楽しくない

□

(質問 60) この30日間では1日平均どのくらいの時間、家で親や保護者の方と一緒に過ごしましたか？

1. ほとんど過ごさなかった
2. 10分未満
3. 10分から29分
4. 30分から1時間
5. 1時間以上
6. その他

(質問61) 2020年の新型コロナウイルス感染症の影響で、学校休校などいつもと違う状況になりましたが、良い影響がありましたか？あてはまるもの、いくつにでもチェックをしてください。

- | | |
|------------------------|------------------------|
| 1. 何も変わらなかった | 4. 兄弟や家族との話が増えて、仲良くなった |
| 2. 学校に行かなくてよいので気が楽になった | 5. 十分に睡眠時間がとれた |
| 3. 趣味や楽しみに時間が使って良かった | 6. その他（ ） |

(質問62) 2020年の新型コロナウイルス感染症の影響で、学校休校などいつもと違う状況になりましたが、悪い影響がありましたか？あてはまるもの、いくつにでもチェックをしてください。

- | | |
|-------------------------------|------------------|
| 1. 何も変わらなかった | 7. 喫煙、飲酒が増えた |
| 2. 睡眠時間がおかしくなった（短い、長い、昼夜逆転など） | 8. 運動不足になった |
| 3. 食事がおかしくなった（回数、時間帯、バランスなど） | 9. 家族の人間関係が悪くなった |
| 4. 勉強ができなかった | 10. 家が経済的に苦しくなった |
| 5. ゲームやインターネットの時間が長くなかった | |
| 6. ストレスがたまり、いらいらするようになった | |

(質問63) 将来の進路をどのように考えていますか？今の気持ちに近いもの1つに○をつけてください。

- | | | | | |
|---------|-------|----------------|----------|--------------------------|
| 1. 高等学校 | 3. 短大 | 5. 大学院 | 7. わからない | <input type="checkbox"/> |
| 2. 専門学校 | 4. 大学 | 6. 今の中学校卒業後の就職 | | |

(質問64) この30日間に、あなたの睡眠の質を全体としてどのように評価しますか？

- | | | | | |
|----------|----------|-----------|-----------|--------------------------|
| 1. 非常によい | 2. かなりよい | 3. かなりわるい | 4. 非常にわるい | <input type="checkbox"/> |
|----------|----------|-----------|-----------|--------------------------|

(質問65) この30日間に、1日平均して何時間くらい眠りましたか？

- | | | | |
|------------|------------|------------|--------------------------|
| 1. 5時間未満 | 3. 6～7時間未満 | 5. 8～9時間未満 | <input type="checkbox"/> |
| 2. 5～6時間未満 | 4. 7～8時間未満 | 6. 9時間以上 | |

(質問66) この30日間に、夜、寝床につく平均時間は何時くらいでしたか？

- | | | | |
|----------------|----------------|--------------|--------------------------|
| 1. 午後10時より前 | 3. 午後11～12時より前 | 5. 午前1～2時より前 | <input type="checkbox"/> |
| 2. 午後10～11時より前 | 4. 午前0～1時より前 | 6. 午前2時以降 | |

(質問67) この30日間に、夜、眠りにつきにくい（なかなか眠れない）ことはありましたか？

- | | | | |
|-------------|------------|----------|--------------------------|
| 1. まったくなかった | 3. 時々あった | 5. 常にあった | <input type="checkbox"/> |
| 2. めったになかった | 4. しばしばあった | | |

(質問68) この30日間に、夜、いったん眠ってから目がさめましたか（夜中に目がさめましたか）？

- | | | | |
|-------------|------------|----------|--------------------------|
| 1. まったくなかった | 3. 時々あった | 5. 常にあった | <input type="checkbox"/> |
| 2. めったになかった | 4. しばしばあった | | |

(質問69) この30日間に、朝早く（明け方）目がさめてしまい、もう一度眠ることが難しいことがありますか？

- | | | | |
|-------------|------------|----------|--------------------------|
| 1. まったくなかった | 3. 時々あった | 5. 常にあった | <input type="checkbox"/> |
| 2. めったになかった | 4. しばしばあった | | |

(質問70) この30日間に、いつもより自分のしていることに生きがいを感じることがありましたか？

- | | | |
|----------------|-------------|--------------------------|
| 1. あった | 3. なかった | <input type="checkbox"/> |
| 2. いつもと変わらなかった | 4. まったくなかった | |

(質問71) この30日間に、いつもより気が重くて落ちこむことは、ありましたか？

- | | | |
|-------------|------------|--------------------------|
| 1. まったくなかった | 3. あった | <input type="checkbox"/> |
| 2. あまりなかった | 4. たびたびあった | |

(質問72) 現在、一緒に住んでいる方々をすべてあげてください。寮生の人は9に加えて実家にいる家族をすべて選んで下さい。(○はいくつでも)

- | | | | |
|---------------|--------------|-----------------|--|
| 1. 父親（単身赴任含む） | 4. 祖父母 | 7. わからない | |
| 2. 母親（単身赴任含む） | 5. 配偶者 | 8. その他（具体的に） | |
| 3. 兄弟姉妹 | 6. 1～5以外の親せき | 9. ひとりぐらし（寮生など） | |

ご協力ありがとうございました。以下は今後の調査についての質問です。

今後同じような調査を実施するときに、協力してもらえますか？
ご協力いただける場合は、□に○をつけてください。

同意欄にチェックをいただいた方には、年に1回程度、メールアドレスまたはLINEアカウントに、アンケート調査協力の案内を送らせていただきます。

中高生の生活習慣に関する全国調査（2020 年版）

中学、高校生の生活習慣は、健康と関係があるため厚生労働省がすすめている健康づくり計画である健康日本21(第2次)にも取り上げられています。中学、高校生の生活習慣についての全国調査は1996年から今までに9度行われています。このたび2017年以降にどのように変化したかを知るために全国の中学校、高等学校からくじ引きで合計数百校を選んで全校生徒に対するアンケート調査を実施することになりました。この調査は未成年者の飲酒やタバコ使用の様子を明らかにするなど、国が健康についての対策を考えるために大変重要な資料になります。この調査は、回答した人に不利益がおよぶようなものではなく、みなさんの健康を守るために使われる大切なものですのでぜひ協力してください。

このアンケートは、個人の秘密を守るために、書いた人が誰かわかるような「名前」等の項目はありません。回答はほとんどが当てはまる項目を選ぶだけです。学校の先生や保護者にもどんな回答をしたかわかりません。回答したデータは集計する大学に送られ、その結果は集計表をつくるためだけに使用し、研究以外の目的には利用しません。回答はありのままを正直に答えてください。

なお、このアンケートの質問文にあるお酒とは日本酒のことではなくビール、日本酒、焼酎、ワイン、ジン、ウイスキー、ブランディー、ウォッカといったアルコール類をまとめた表現だと思ってください。

厚生労働省 飲酒や喫煙等の実態調査と生活習慣病予防のための減酒の効果的な介入法の開発に関する研究グループ
研究代表者 尾崎米厚（鳥取大学医学部 環境予防医学分野 教授）

※ご協力いただける場合は、□に○をつけてください。

回答はすべて統計的に処理し、プライバシーは保護されます。

また、個人の回答が学校を含めた第三者に知らされることはありません。

すべてのアンケートにご協力いただき、メールアドレスを入力するか LINE で友だちになると、抽選で 2000 円分の QUOpay（クオ・カード・ペイ）を合計 500 名様にプレゼントします。景品は登録いただいたメールまたは LINE アカウントにお送りします。

|-----------|-----------|-----------|
| 1. 飲まない | 3. 年に数回 | 5. 週に1、2回 |
| 2. 年に1回以下 | 4. 月に1、2回 | 6. 週に3回以上 |

(17)

(質問9) 自分からすすんでまたはお酒とわかって初めてお酒を飲んだのは何才ころですか？

- | | | | |
|----------------|-----------|-----------|------------|
| 1. 一度も飲んだことがない | 3. 9か10才 | 5. 13か14才 | 7. 17才よりうえ |
| 2. 8才かそれより若く | 4. 11か12才 | 6. 15か16才 | |

(18)

(質問10) 初めて友だちや仲間とお酒を飲んだのは何才ころですか？

- | | | | |
|----------------|-----------|-----------|------------|
| 1. 一度も飲んだことがない | 3. 9か10才 | 5. 13か14才 | 7. 17才よりうえ |
| 2. 8才かそれより若く | 4. 11か12才 | 6. 15か16才 | |

(19)

(質問11) よく飲むお酒はどんな種類ですか？あてはまるものをいくつでも○をつけてください。

- | | |
|---------|-----------------------------|
| 1. 飲まない | 5. 焼酎、サワー類 |
| 2. ビール | 6. アルコール度が低く甘いお酒（果実酒など） |
| 3. 日本酒 | 7. ウイスキー、ブランディー、ウォッカなどの強いお酒 |
| 4. ワイン | |

(20)

(質問12) この30日間に、アルコールの入っていない（ノンアルコール、アルコールフリー、アルコールゼロ）ビール、カクテル、酎ハイ飲料を飲んだ日は合計何日になりますか？

- | | | | |
|---------|---------|-----------|------------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 每日（30日） |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | |

(14)

(質問13) この30日間に、何日、エナジードリンク（モンスター、モンスターエナジー、レッドブル、コカ・コーラエナジー、ゾーン（ZONe）など）を飲んだ日は合計何日になりますか？

- | | | | |
|---------|---------|-----------|------------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 毎日（30日） |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | |

(14)

(質問14) お酒をエナジードリンクと混ぜて飲むことがどのくらいの頻度ですか？

- | | | |
|-----------|-----------|-----------|
| 1. 飲まない | 3. 年に数回 | 5. 週に1、2回 |
| 2. 年に1回以下 | 4. 月に1、2回 | 6. 週に3回以上 |

(17)

(質問15) お酒を主にどうやって手に入っていますか？あてはまるものをいくつでも○をつけてください。

- | | |
|----------------|----------------------------|
| 1. 一度も飲んだことがない | 5. 自動販売機で買う |
| 2. 家にあるお酒を飲む | 6. 居酒屋、カラオケボックス、飲み屋などで飲む |
| 3. 友だちや知人からもらう | 7. コンビニエンスストア、スーパーマーケットで買う |
| 4. 酒屋で買う | 8. その他の方法で |

□

(質問16) あなたは、この30日間に年齢のためにお酒を売ってもらえたことがありますか？

- | | | |
|------------------|--------------|----------------|
| 1. この間、買おうとしなかった | 2. 時々売ってもらえた | 3. いつでも売ってもらえた |
|------------------|--------------|----------------|

□

(質問17) あなたは、お父さんかお母さんにお酒を飲むのをすすめられたことがありますか？

1. はい

2. いいえ

3. おぼえていない

□

(質問18) あなたは、親がお酒を飲むのを嫌だと思ったことがありますか？

1. ある

2. ない

3. 親はお酒を飲まない

□

(質問19) あなたは、未成年者の飲酒禁止をどう思いますか？自分の気持ちに近いもの1つに○をつけてください。

1. 当然だと思う

3. 成人が飲めて、未成年者が飲めないのはおかしいと思う

)

(質問24) また、どこで、お酒を飲んだ人からイヤだと思うことをされましたか？

1. イヤだと思うことはされたことがない

3. 自分以外の人の家

5. アルバイト先

2. 自分の家

4. 食事に行った飲食店

6. その他

□

(質問25) この30日間で、あなたはお酒の広告(コマーシャル、CM)をどこで見かけましたか？あてはまるものをいくつでも○をつけてください。

1. ウェブサイトや動画サイト

2. テレビ

3. コンビニエンスストアやスーパーなどの店に貼ってあるポスター

4. 駅や電車・バスの中

5. まったく見なかった、見たがどこかわからない

ここからはタバコについての質問です。

※これらの質問では、「紙巻タバコ」、「加熱式タバコ」、「電子タバコ」「新型タバコ（加熱式タバコもしくは電子タバコ）」、「タバコ（これらすべてを含む）」を区別して尋ねます。

回答の際に注意してください。

(質問26) あなたは、今までに紙巻きタバコ（紙を巻いたぼうの形をしたもので、火をつけて吸う普通のタバコ）を一口でも吸ったことがありますか？

1. ない

2. ある

□

(質問27) あなたが紙巻きタバコを初めて吸ったのは何才ころですか？1つだけ選んで数字に○をつけてください。

1. 吸ったことがない

4. 9才

7. 12才

10. 15才

13. 18才以上

2. 7才以下

5. 10才

8. 13才

11. 16才

□

3. 8才

6. 11才

9. 14才

12. 17才

(質問28) あなたが新型タバコ（加熱式タバコもしくは電子タバコ）を初めて吸ったのは何才ころですか？
1つだけ選んで数字に○をつけてください。

1. 吸ったことがない
2. 7才以下
3. 8才

4. 9才
5. 10才
6. 11才

7. 12才
8. 13才
9. 14才

10. 15才
11. 16才
12. 17才

13. 18才以上

(質問29) この30日間に、何日、紙巻きタバコを吸いましたか？

1. 0日
2. 1か2日

3. 3～5日
4. 6～9日

5. 10～19日
6. 20～29日

7. 毎日（30日）

(質問30) この30日間に、1日平均どのくらいの本数の紙巻きタバコを吸いましたか？

1. この間、吸っていない
2. 1日1本に満たない
3. 1本

4. 2～5本
5. 6～10本
6. 11～15本

7. 16～20本
8. 21本以上

(質問31) この30日間に、自分の吸う紙巻きタバコをおもにどのようにして手に入りましたか？
あてはまるものにいくつでも○をつけてください。

1. この間、吸っていない
2. コンビニエンスストア、スーパー・マーケット、ガソリンスタンド等の店で買った
3. 自動販売機で買った
4. タバコ屋で買った
5. 誰からもらった
6. 家にあるタバコを吸った
7. インターネットで買った
8. その他の方法で

(質問32) あなたは、今までに加熱式タバコを一口でも吸ったことがありますか？（加熱式たばことは、（加熱式たばことは、アイコス(iQOS)、グロー(glo)、プルームテック(Ploom TECH)、パルズ(PULZE)などの商品です））

1. ない
2. ある

(質問33) この30日間に、何日、加熱式タバコを吸いましたか？

1. 0日
2. 1か2日

3. 3～5日
4. 6～9日

5. 10～19日
6. 20～29日

7. 每日（30日）

(質問34) あなたは、今までに電子タバコを一口でも吸ったことがありますか？（電子タバコとは、マイブルー(myblu)、ドクターベイプ(DR.VAPE)、イーゴ(eGO AIO)、ゼロスティック(ZERO STICK)、ベポレッソ(VAPORESSO OSMALL)などの商品のことです）

1. ない
2. ある

(質問35) この30日間に、何日、電子タバコを吸いましたか？

1. 0日
2. 1か2日

3. 3～5日
4. 6～9日

5. 10～19日
6. 20～29日

7. 每日（30日）

(質問36) この30日間に、自分の吸う加熱式タバコや電子タバコをおもにどのようにして手に入りましたか？あてはまるものにいくつでも○をつけてください。

1. この間、吸っていない
2. コンビニエンスストア、スーパー・マーケット、ガソリンスタンド等の店で買った
3. 自動販売機で買った
4. タバコ屋または新型タバコ販売店で買った
5. 誰からもらった
6. 家にあるタバコを吸った
7. インターネットで買った
8. その他の方法で

(質問37) あなたが現在吸っているタバコの銘柄の名前（商品名）を略さず1つだけ書いてください。吸っていない人は書かないでください（加熱式タバコや電子タバコを含めあらゆるタバコのうち最もよく吸った商品の名前です）。

(

)

□～□

(質問38) 紙巻タバコは買いたくなかったと思いますか？その理由を、いくつでも○をつけてください。

- | | |
|------------------------|--------------------|
| 1. タバコを吸った（買った）ことがない | 6. タバコの値段が高くなかった |
| 2. 買いたくなかったとは思わない | 7. タバコを吸える場所が減った |
| 3. 年齢確認が厳しくなった | 8. 周りの目が気になるようになった |
| 4. 自販機が使えなくなった（タスボが必要） | 9. その他（ ） |
| 5. 家にタバコがなくなった | |

□

(質問39) あなたは紙巻タバコをやめたいと思いますか？1つだけ選んで数字に○をつけてください。

- | | |
|-----------------------|-------------|
| 1. タバコを吸っていない | 4. 本数を減らしたい |
| 2. 実際、やめようと取り組んだことがある | 5. やめたくない |
| 3. やめたいと思う | 6. わからない |

□

(質問40) あなたはこの30日間に年齢のために紙巻タバコまたは加熱式タバコを売ってもらえなかったことがありますか？

- | | |
|------------------|-----------------------------|
| 1. この間、買おうとしなかった | 3. いつでも売ってもらえた（年齢はごまかした） |
| 2. 時々売ってもらえなかった | 4. いつでも売ってもらえた（年齢はごまかしていない） |

□

(質問41) あなたはこの30日間に年齢のために電子タバコを売ってもらえなかったことがありますか？

- | | |
|------------------|-----------------------------|
| 1. この間、買おうとしなかった | 3. いつでも売ってもらえた（年齢はごまかした） |
| 2. 時々売ってもらえなかった | 4. いつでも売ってもらえた（年齢はごまかしていない） |

□

(質問42) あなたは、親が紙巻タバコを吸うのを嫌だと思ったことがありますか？

- | | | |
|-------|-------|---------------|
| 1. ある | 2. ない | 3. 親はタバコを吸わない |
|-------|-------|---------------|

□

(質問43) あなたの親や兄弟、友だちは禁煙に取り組んでいますか？あてはまるものにいくつでも○をつけてください。

- | | |
|---------------------------|------------------|
| 1. 周りにタバコを吸う人・禁煙している人はいない | 4. 友だちが禁煙している |
| 2. 親が禁煙している（電子たばこを使わずに） | 5. 親が電子たばこを使っている |
| 3. 兄弟が禁煙している | |

□

(質問44) 朝起きて、すぐにタバコを吸うか、タバコを吸いたいと思ったことはありますか？

- | | |
|-------------------|----------------------|
| 1. タバコを吸ったことがない | 4. ときどき朝吸ったり、吸いたいと思う |
| 2. 今はタバコを吸っていない | 5. いつも朝吸ったり、吸いたいと思う |
| 3. 朝吸いたいと思ったことはない | |

□

(質問45) タバコを吸うと身体に害があると思いますか？1つを選んで○をつけてください。

- | | |
|----------------------------|------------|
| 1. 害があるとは思わない | 3. 害があると思う |
| 2. 少少はあるだろうが、たいしたことではないと思う | 4. わからない |

□

(質問46) 他人の紙巻タバコからの煙はあなたにとって有害であると思いますか？

- | | | | |
|-----------|---------------|-------------|---------|
| 1. そう思わない | 2. おそらくそう思わない | 3. おそらくそう思う | 4. そう思う |
|-----------|---------------|-------------|---------|

□

(質問47) 他人の加熱式タバコからの煙はあなたにとって有害であると思いますか？

- | | | | |
|-----------|---------------|-------------|---------|
| 1. そう思わない | 2. おそらくそう思わない | 3. おそらくそう思う | 4. そう思う |
|-----------|---------------|-------------|---------|

□

(質問48) この7日間のうちで、家で、あなたのいるところで、誰かが紙巻タバコを吸ったのは何日間になりますか？

- | | | |
|----------|----------|-------|
| 1. 0日 | 3. 3から4日 | 5. 7日 |
| 2. 1から2日 | 4. 5から6日 | |

□

(質問49) この7日間のうちで、家以外の場所で、あなたのいるところで、誰かが紙巻タバコを吸ったのは何日間になりますか？

- | | | |
|----------|----------|-------|
| 1. 0日 | 3. 3から4日 | 5. 7日 |
| 2. 1から2日 | 4. 5から6日 | |

□

(質問50) この30日間で、あなたは加熱式タバコの広告や宣伝をどこで見ましたか？あてはまるものをいくつでも○をつけてください。（ここでいうタバコ広告とは、製品の宣伝広告だけであり、喫煙マナー やタバコ会社のイメージの広告やキャッチコピー（たとえばＪＴなら「ひとのときを想う」、「ひろえば街が好きになる運動」、「ひとつずつですが、未来へ」等）が入ったものは含みません。）

1. ウェブサイトや動画サイト
2. コンビニエンスストアやスーパーなどの店に貼ってあるポスター
3. 駅や電車・バスの中
4. まったく見なかった、見たがどこかわからない

あなたの、生活についてお聞きします。

(質問51) あなたは、朝食を毎日食べますか？

- | | | |
|-----------------------|----------|-------------|
| 月～金：1. ほとんど毎日食べている | 2. 時々食べる | 3. ほとんど食べない |
| 土・日・祝日：1. ほとんど毎日食べている | 2. 時々食べる | 3. ほとんど食べない |

(質問52) あなたは、家の食事で1週間に野菜をどのくらい食べていますか？

1. 必ず毎日
2. 週4～5日
3. 週2～3日
4. ほとんど食べない

(質問53) あなたは、インスタントラーメンやカップめんをどのくらい食べていますか？

1. 週3回より多い
2. 週1～2回
3. 月1～3日回
4. 月1回より少ない

□

(質問54) あなたはクラブ活動に参加していますか？

1. 積極的に参加している
2. 積極的でないが参加している
3. 参加していない

□

(質問 55) この30日間に、体育の授業以外で、30分以上体を動かす運動やスポーツをした日が何日ありましたか？

- | | | | |
|---------|---------|-----------|------------|
| 1. 0日 | 3. 3～5日 | 5. 10～19日 | 7. 毎日（30日） |
| 2. 1か2日 | 4. 6～9日 | 6. 20～29日 | |

(質問 56) この30日間に、体育の授業以外で、1日平均どのくらいの時間、体を動かす運動やスポーツを行いましたか？

- | | | |
|--------------|------------|------------|
| 1. まったくしなかった | 3. 1～2時間未満 | 5. 3～5時間未満 |
| 2. 1時間未満 | 4. 2～3時間未満 | 6. 5時間以上 |

(質問57) この30日間に、1日平均どのくらいの時間、学校の授業をオンラインで受けましたか？

- | | | |
|--------------|------------|------------|
| 1. まったくしなかった | 3. 1～2時間未満 | 5. 3～5時間未満 |
| 2. 1時間未満 | 4. 2～3時間未満 | 6. 5時間以上 |

(質問 58) この30日間に、1日平均どのくらいの時間、学校以外の授業をオンラインで受けましたか？

- | | | |
|--------------|------------|------------|
| 1. まったくしなかった | 3. 1～2時間未満 | 5. 3～5時間未満 |
| 2. 1時間未満 | 4. 2～3時間未満 | 6. 5時間以上 |

(質問59) 学校は楽しいですか？

1. 楽しい
2. どちらとも言えない
3. 楽しくない

□

(質問 60) この30日間では1日平均どのくらいの時間、家で親や保護者の方と一緒に過ごしましたか？

1. ほとんど過ごさなかった
2. 10分未満
3. 10分から29分
4. 30分から1時間
5. 1時間以上
6. その他

(質問61) 2020年の新型コロナウイルス感染症の影響で、学校休校などいつもと違う状況になりましたが、良い影響がありましたか？あてはまるもの、いくつにでもチェックをしてください。

- | | |
|------------------------|------------------------|
| 1. 何も変わらなかった | 4. 兄弟や家族との話が増えて、仲良くなった |
| 2. 学校に行かなくてよいので気が楽になった | 5. 十分に睡眠時間がとれた |
| 3. 趣味や楽しみに時間が使って良かった | 6. その他（ ） |

(質問62) 2020年の新型コロナウイルス感染症の影響で、学校休校などいつもと違う状況になりましたが、悪い影響がありましたか？あてはまるもの、いくつにでもチェックをしてください。

- | | |
|-------------------------------|------------------|
| 1. 何も変わらなかった | 7. 喫煙、飲酒が増えた |
| 2. 睡眠時間がおかしくなった（短い、長い、昼夜逆転など） | 8. 運動不足になった |
| 3. 食事がおかしくなった（回数、時間帯、バランスなど） | 9. 家族の人間関係が悪くなった |
| 4. 勉強ができなかった | 10. 家が経済的に苦しくなった |
| 5. ゲームやインターネットの時間が長くなかった | |
| 6. ストレスがたまり、いらいらするようになった | |

(質問63) 将来の進路をどのように考えていますか？今の気持ちに近いもの1つに○をつけてください。

- | | | | | |
|---------|-------|----------------|----------|--------------------------|
| 1. 高等学校 | 3. 短大 | 5. 大学院 | 7. わからない | <input type="checkbox"/> |
| 2. 専門学校 | 4. 大学 | 6. 今の中学校卒業後の就職 | | |

(質問64) この30日間に、あなたの睡眠の質を全体としてどのように評価しますか？

- | | | | | |
|----------|----------|-----------|-----------|--------------------------|
| 1. 非常によい | 2. かなりよい | 3. かなりわるい | 4. 非常にわるい | <input type="checkbox"/> |
|----------|----------|-----------|-----------|--------------------------|

(質問65) この30日間に、1日平均して何時間くらい眠りましたか？

- | | | | |
|------------|------------|------------|--------------------------|
| 1. 5時間未満 | 3. 6～7時間未満 | 5. 8～9時間未満 | <input type="checkbox"/> |
| 2. 5～6時間未満 | 4. 7～8時間未満 | 6. 9時間以上 | |

(質問66) この30日間に、夜、寝床につく平均時間は何時くらいでしたか？

- | | | | |
|----------------|----------------|--------------|--------------------------|
| 1. 午後10時より前 | 3. 午後11～12時より前 | 5. 午前1～2時より前 | <input type="checkbox"/> |
| 2. 午後10～11時より前 | 4. 午前0～1時より前 | 6. 午前2時以降 | |

(質問67) この30日間に、夜、眠りにつきにくい（なかなか眠れない）ことはありましたか？

- | | | | |
|-------------|------------|----------|--------------------------|
| 1. まったくなかった | 3. 時々あった | 5. 常にあった | <input type="checkbox"/> |
| 2. めったになかった | 4. しばしばあった | | |

(質問68) この30日間に、夜、いったん眠ってから目がさめましたか（夜中に目がさめましたか）？

- | | | | |
|-------------|------------|----------|--------------------------|
| 1. まったくなかった | 3. 時々あった | 5. 常にあった | <input type="checkbox"/> |
| 2. めったになかった | 4. しばしばあった | | |

(質問69) この30日間に、朝早く（明け方）目がさめてしまい、もう一度眠ることが難しいことがありますか？

- | | | | |
|-------------|------------|----------|--------------------------|
| 1. まったくなかった | 3. 時々あった | 5. 常にあった | <input type="checkbox"/> |
| 2. めったになかった | 4. しばしばあった | | |

(質問70) この30日間に、いつもより自分のしていることに生きがいを感じることがありましたか？

- | | | |
|----------------|-------------|--------------------------|
| 1. あった | 3. なかった | <input type="checkbox"/> |
| 2. いつもと変わらなかった | 4. まったくなかった | |

(質問71) この30日間に、いつもより気が重くて落ちこむことは、ありましたか？

- | | | |
|-------------|------------|--------------------------|
| 1. まったくなかった | 3. あった | <input type="checkbox"/> |
| 2. あまりなかった | 4. たびたびあった | |

(質問72) 現在、一緒に住んでいる方々をすべてあげてください。寮生の人は9に加えて実家にいる家族をすべて選んで下さい。(○はいくつでも)

- | | | | |
|---------------|--------------|-----------------|--|
| 1. 父親（単身赴任含む） | 4. 祖父母 | 7. わからない | |
| 2. 母親（単身赴任含む） | 5. 配偶者 | 8. その他（具体的に） | |
| 3. 兄弟姉妹 | 6. 1～5以外の親せき | 9. ひとりぐらし（寮生など） | |

ご協力ありがとうございました。以下は今後の調査についての質問です。

今後同じような調査を実施するときに、協力してもらえますか？
ご協力いただける場合は、□に○をつけてください。

同意欄にチェックをいただいた方には、年に1回程度、メールアドレスまたはLINEアカウントに、アンケート調査協力の案内を送らせていただきます。

保護者同意欄

アンケート協力依頼のメールを受け取ることを同意します。

本人同意欄

アンケート協力依頼のメールを受け取ることを同意します。

以下にメールアドレスを入力するか、LINEで下のQRコードを読み取ってください。抽選で2000円分のQU0pay（クオ・カード・ペイ）を合計500名様にプレゼントします。景品は登録いただいたメールまたはLINEアカウントにお送りします。メールアドレスまたはLINEアカウントは、謝礼のお渡し、または調査の実施以外の目的には使用いたしません。

メールアドレス入力欄

(送信すると確認メールが送られます)

LINEの場合
は、右のQRコードを読み取つ
てください。

当選された方には、1ヶ月ぐらいで、ご登録いただいたメールまたはLINEにQU0pay（クオ・カード・ペイ）をお送りします。当選結果の発表は景品の発送をもってかえさせていただきます。

ご協力ありがとうございました。

令和2年度厚生労働科学研究費補助金（循環器疾患・糖尿病等生活習慣病対策総合研究事業）

分担研究報告書

産業保健の現場における減酒支援ブリーフインターベンションの効果検証に関する研究

研究分担者 桑原祐樹、金城文、尾崎米厚

鳥取大学医学部 環境予防医学分野

研究要旨

不適切なアルコール使用の健康影響は重大であり、社会面に及ぶ影響による損失は多大である。世界保健機構や厚生労働省では二次予防としての効果的な戦略の一つとして、飲酒者すべてを対象に危険な飲酒のスクリーニングを行い、リスクが高いと思われるものに対して短時間のカウンセリングを行うこと（Screening and Brief Intervention: SBI）を推奨している。こうした介入をプライマリケアの医療現場で行うことの有効性に関しては既に諸外国で確立されたが、現場への浸透は十分ではない。一方で、医療現場外への展開が着目される中、産業保健の現場は重要な減酒支援の介入機会となりうる。

今回我々は働き盛りの従業員を対象に、産業保健現場で保健師が介入する SBI を実施することで、飲酒習慣が改善するかどうかを検証するために無作為化比較試験を実施した。鳥取県・島根県で協力の得られた 5 つ事業所の従業員 2,276 名の不適切な飲酒のスクリーニング

(AUDIT) の結果を参考し、8 点以上で包含基準を満たした 380 名のハイリスク飲酒者を無作為に割り付けた。研究班で作成したワークシートによる通常版の節酒支援（15 分程度）もしくは、短縮版の節酒支援（5 分程度）による介入群とリーフレット提供（コントロール群）の対照群の 3 群へ介入を実施し、半年後の週飲酒量の変化を主要評価項目として比較し、介入効果を検証した。

2019 年 1 月から 12 月の期間に 351 名から研究参加の同意が得られた。研究参加者は各群で均等に割り付けられた。半年後の 1 週間当たりの飲酒量の変化において、通常版介入群で平均 35.4 g/週の飲酒量の減少がみられた。一元配置分散分析において 3 群の平均値の差は有意であったが、多重検定を考慮すると介入効果に統計学的な有意差は示されなかった。1 年後の 1 週間当たりの飲酒量の変化は、通常版介入群で平均 29.2 g/週の減少がみられたが、3 群の差は統計学的に有意ではなかった。飲酒量の変化を従属変数とした重回帰分析やロジスティック回帰分析でも半年後の減酒に通常版介入が有意な関連を示した。他に減酒と有意な関連のある説明要因は認められなかった。また、1 年後の評価時期の違いによって 1 年後の介入効果に差が認められた。

今回の結果は、産業保健現場での保健師による SBI が医療現場と遜色のない効果を示すという可能性を強く示唆している。また、今回効果が実証されたのは 15 分程度の従来通りの介入方法であった。1 年後の評価で有意な介入効果が示されなかつたが、新型コロナウイルス流行の影響も考えられる。1 年後においても効果が持続している可能性が示された。産業保健現場での SBI の実施は、医療現場よりも若年の集団に対して予防効果が期待され、企業や地域の健康指標を改善し、アルコールによる害を減らす重要な戦略の一つとなる可能性がある。

研究協力者：藤井麻耶（鳥取大学医学部環境予防医学分野 助教）

A. 研究目的

有害なアルコールの使用は世界的に喫緊の健康課題である[1]。不適切な飲酒は非感染性疾患 (Non Communicable Diseases: NCDs) の重要なリスク要因であり、世界中の死亡率、疾病率、早世の主要な原因の一つとなっている[2, 3]。また、アルコールの消費は暴力、けがや外傷などの社会問題や、社会的損害とそれによる、経済的損失にも関連が示されている[3]。こうした健康、社会、経済面でのアルコールのリスクを受け、世界保健機構 (World Health Organization: WHO) はアルコールによる世界的負荷や損失を削減するために予防戦略を打ち出している。いくつかの戦略が推奨される中に、ハイリスク飲酒者に対して簡易的な心理社会的カウンセリングを提供することが含まれている[4]。医療保健従事者はアルコール使用のスクリーニング、それに続く簡易なカウンセリングそして必要であれば専門医への紹介や治療薬処方を提供することを期待されている。2018年にWHOから発信したイニシアティブ「SAFER (S: Strengthen restrictions on alcohol availability; A: Advance and enforce drink driving counter measures; F: Facilitate access to screening, brief interventions and treatment; E: Enforce bans or comprehensive restrictions on alcohol advertising, sponsorship, and promotion; R: Raise prices on alcohol through excise taxes and pricing policies)」においても、飲酒状況のスクリーニングと簡易介入の促進が強調されている[3]。

有害なアルコール使用のスクリーニングと短時間のカウンセリングを含めた簡易介入

(Screening and Brief Intervention: SBI) がプライマリケアなどの医療現場で有効であることは科学的な根拠が立証されてきた「5-9」。しかしながら、WHOのイニシアティブや豊富なエビデンスにも関わらず SBI は日常診療の中で十分に実施されていないという課題が指摘されている[10, 11]。したがって、SBI を実践する現場を広げることはアルコールによる深刻な悪影響を削減するために重要である。既存の研究では病院の救急外来の現場[12, 13]や病棟[14]など様々な医療現場での SBI の効果の検証が行われている。また、医療現場外のセッティングでの SBI の効果検証として、職場、行政サービス機関、刑事司法機関などで同様の試みが報告されている[15, 16]。

特に職域での介入には潜在的な利点を有している。まず、医療の現場でアプローチすることが難しい集団を対象にしていることである。また、健康問題以外の害である、家庭での問題や労働災害を含んだアルコールの悪影響に取り組むことが出来るかもしれない[10]。職場での SBI の効果を検証したシステムティックレビュー・メタアナリシスは、アルコール消費量の減少への有効性を支持する結果を示している[17]。故に、SBI の職域への展開はアルコールの様々な害を予防する重大な戦略となる可能性を秘めている。

日本においても、有害なアルコール使用は重大な公衆衛生上の課題として認知されている[18]。健康日本（第二次）では健康のリスクを高める飲酒量（純アルコール換算）が定義され、男性で 40g/日以上、女性で 20g/日以上となっている。また、ハイリスク飲酒者の割合を削減することが目標の一つとして掲げられている[19]。さらに 2015 年にはアルコール障害対策基本法が施行された。同法では SBI の二次予防対策への重要な役割が述べ

られている。しかしながら、過去の日本の研究ではアルコール関連精神疾患の医療サービスの需要と供給の不一致が指摘されており、こうしたことはプライマリケア現場でのSBIの実施が不十分であることを示唆する可能性がある[20]。

このような背景からか、職場でのSBIは注目されており、日本人の従業員を対象に介入効果を検証した研究が行われている[21-23]。彌富らの研究[22]はWHOが開発した標準的なスクリーニングツールであるAUDIT (Alcohol Use Disorder Identification Test) [24]を用いた対照群のない介入研究であり、他の2つは特定のスクリーニングツールを用いず、比較的多量飲酒者を対象とした介入研究であった。さらに、既存のエビデンスにも関わらず[5]、それら2つの研究は飲酒に対する簡易介入のアルコール消費量の減少への効果は不明であると結論付けている。前述の職域でのSBIの持つ利点を考慮すると、適切なスクリーニングはプライマリケアの医療現場で捉えることの難しいハイリスク飲酒者を同定するために不可欠である。改めて、「簡易で実践的な」飲酒への介入の効果を適切なスクリーニングを用いて同定した対象者に対して実施することの有効性を検証することは重要である。日常診療での実現可能性を考慮すると、頻回にフィードバックを行うことは困難であるかもしれない。さらに、既存の研究は幅広いアルコール関連問題、飲酒に関連した血液データ、健康関連QOLや仕事のパフォーマンスについてSBIの介入効果を検証できていない。

今回の研究の目的は、職域において、AUDITをスクリーニングに用い、2つの異なった過度の飲酒を減らす簡易介入モデルが、医学的・社会的な効果をもたらすかどうかを検証することである。

B. 研究方法

調査対象者と追跡

・セッティング

鳥取県、島根県の5つの事業所に参加を呼び掛け、各事業所に努める従業員を対象とした。事業所の規模は従業員数35名から910名と広がりがあった。4つの事業所には独自の健康管理室を有しており、常勤の産業保健スタッフを配置していた。

・参加の呼びかけとスクリーニング

日本においては特定健康診査・特定保健指導の制度があり、事業所健診を法令で義務付けている[25,26]。また、AUDITによるハイリスク飲酒のスクリーニングは同制度の中において推奨されている。従って、我々は事業所健診の一環として自己記入式のAUDITを実施している事業所に連絡を取り、各施設の健康管理スタッフや衛生担当者を訪問して研究の詳細について説明を行い、事業所の管理者と保健・衛生スタッフの理解と同意を得た。

・包含基準

20歳以上で意思表示がしっかりとでき、AUDITで8点以上のものを対象にした。このカットオフ点は既存の文献を参考に定義した[27]。

・除外基準

75歳以上のもの、前年までにアルコール依存症の治療プログラムに参加しているもの、過去12か月にアルコール離脱症状を認めるもの、過去3か月以内に主治医等から飲酒行動に関する指導を受けているもの、妊娠中のもの、自殺企図の症状がみられるものは対象から除外した。

・説明と同意

それぞれの企業の健康管理責任者は2019年1月から12月の間に従業員に参加を呼び掛けることに同意した。2段階の同意取得の行程を経た。ま

ず健康衛生管理担当者が参加対象者の条件を確認し、対象者の候補を選定した。この段階では個人情報の授受はない。上記の研究の選定基準に合致する従業員は研究スタッフから口頭及び文書を持って説明を受けた。署名付きの文書でインフォームドコンセントを確認し、研究参加者のデータ、連絡先、事業所健診のデータ、を研究班が今回の研究を目的に使用することと、介入後 6か月と 12か月の時点での追跡調査を行うことについて了承を得た。このインフォームドコンセントに引き続いだ、同意を得られたものが初回アンケートに回答した。研究スタッフがアンケートの回答の完成を確認した後に、割り当てられた 3つのうちのいずれかの介入を行った。

・盲検化

無作為割り付けは個人単位で行った。包含基準を満たした研究参加者はコンピューターで発生した乱数をもとに 3群に割り付けられた。

簡易介入のマニュアルとトレーニング

今回の研究では、看護師の資格を有し、協力が得られた医療従事者が研究参加者に対して簡易介入を行った。研究開始前にそれらの医療従事者はアルコール簡易介入の研修を受けた。トレーニングプログラムは今回の研究のために研究班で開発した e ラーニングとロールプレイで構成された。プログラムでは AUDIT の基本的知識、どのように問題飲酒者に接するかのやり取りの基礎を学習した[28]。トレーニングマニュアルの内容には行動変容モデル[29]や動機付け面接[30]の手法が含まれた。さらに、十分に飲酒の簡易介入に熟練した医師の実際の診療を見学した。

介入方法

・リーフレット提供群（対照群）

対照群に対しては初回アンケートの記入後に自身の AUDIT の結果について説明をし、その後

研究班で作成したリーフレットを手渡した。

・簡易的なアドバイスとカウンセリング

（通常版介入群）

標準的な介入方法を用いたこの介入群ではアンケート回答後に約 15 分間の飲酒行動に関するアドバイスやカウンセリングを提供した。介入は上記の看護師の資格を持ったスタッフが研究班で作成したワークシートをもとに行った。介入場面ではワークシートに記された 6 つの課題を完遂するように努めた。ワークシートの内容は、認知行動療法、AUDIT の説明と結果のフィードバック、飲酒のメリット・デメリット、飲酒行動に対する目標設定、多量飲酒になりそうな状況の対処方法などを含んだ。

・5 分での簡易アドバイス群

（短縮版介入群）

このグループでは、アンケート回答後に通常 15 分程度のカウンセリングを 5 分間に集約した簡易介入を行った。上記の通常版介入群と同じワークシートを用いて、6 個の課題のうち最低 3 つ程度を完遂することを目標として介入を行った。例えば、最低限 AUDIT の説明と結果のフィードバック、飲酒行動に関する目標設定を含めるよう努めた。

各介入は研究参加のリクルートの際に 1 度だけ行った。すべての研究参加者には、研究班で開発した飲酒日記と自己学習資料を有したスマートフォンのアプリを紹介した（参照 URL：<https://apps.apple.com/jp/app/飲酒アンケート/id1448122338>）。上記のリーフレットやワークシートは鳥取大学医学部環境予防医学分野のホームページに掲載し無料公開している（<https://www.med.tottori-u.ac.jp/introduction/medicine/about/3318/3327/23771.html>）。

主要評価項目

主要評価項目は介入から半年後の 1 週間当たりの純アルコール換算した飲酒量（グラム/週）の変化に設定した。自己記入式調査票を用いて、飲酒の頻度、過去 30 日の機会大量飲酒の有無、普段の飲酒量を聴取し、初回、半年後、1 年後でそれぞれ評価した。この 3 つの質問項目は AUDIT[24]、AUDIT-C[31]の質問項目として含まれている。「機会大量飲酒」は 1 回あたりに純アルコール換算で 60g 以上の飲酒をすることと定義した。また、1 週間当たりのアルコール摂取量は飲酒頻度と普段の飲酒量的回答をもとに計算した。

その他の追跡する評価項目として、救急外来受診の回数、健診での血液データ、健康関連 QOL (SF-8) [32,33]、睡眠障害[34]、心理的健康状態[35]、身体活動量[36,37]、食習慣[38]、喫煙、仕事のパフォーマンス[39,40]が含まれた。

研究参加者には初回アンケート回答時に謝礼として 1,000 円の QUO カードを手渡した。さらに半年後と 1 年後それぞれでアンケート回答を研究事務局が確認した後に 1,000 円ずつの QUO カードを郵送した。

サンプルサイズ計算

サンプルサイズ計算は個人レベルでの主要評価項目の効果量（介入から半年後のアルコール摂取量の変化量）をもとに計算した。過去のプライマリケア現場での研究を集約したメタアナリシス[5]において、効果量は純アルコール換算で 40 グラム/週程度であると示されている。既存文献[41]の週アルコール摂取量の標準偏差を参照し、5%の有意確率で 80%の検出力の条件で上記効果量の有意差を両側検定で検知すると仮定して、各介入群、対照群にそれぞれ 100 人の被験者が必要と見積り、計 300 人が必要と判断した。研究班の過去の経験や職場での類似研究の脱落率を加味して 10%が脱落することを考慮して最終的に各群 110 例、合計で 330 例の被験者

を確保することを目標とした。

統計分析

初めに、研究参加者のベースラインデータを集計し、各群の比較を行った。また、半年後、1 年後の追跡データを用いて、各群での介入前後の週飲酒量の変化量の比較を行った。割り付けられた 3 群の平均の差の検定には一元配置分散分析を用いた。一元配置分散分析で 3 群の有意差がみられた際には多重検定を考慮して Bonferroni 法による有意確率 P 値の補正を行って、各群の差を統計学的に評価した。さらに、クロス集計を用いて、一定量飲酒量が変化したものとの割合、各追跡時点での飲酒頻度、を割り付け群別に比較した。また、半年時点で 40g 以上飲酒量減少したもの、1 年後の時点で 40g 以上飲酒量減少したもの、半年・1 年後時点でともに 40g 以上飲酒量減少したもの、半年・1 年後時点でともに 20g 以上飲酒量減少したもの、とそうでない者で集団の基本特性にどのような違いがあるかを比較した。

さらに、飲酒量の変化を従属変数とし、各説明変数を含めた重回帰分析とロジスティック回帰分析を実施することで説明変数の調整後も飲酒量の改善が認められたか、介入パターン以外に関連している要因がないかどうかを検証した。追跡中に新型コロナウイルスの流行があり、評価時期によって今回の研究対象者を 2 群にわけ、1 年後の評価が 2020 年 7 月末までの集団と 1 年後の評価が 2020 年 8 月以降の集団で介入効果に違いがないかを検証した。

Intention-to-treat (ITT) 分析（脱落者の飲酒量や飲酒頻度を初回と変化なしと見なして分析）を基本とする。しかし、追加分析としてプロトコール通りに追跡できた Per protocol 解析（脱落者を分析から除外）や年齢や職種で層別した集団内でのサブグループ解析を行う。

倫理的事項

本研究は鳥取大学医学部倫理審査委員会に申請し、承認を受けている（承認番号 18B002）。本介入試験は大学病院医療情報ネットワーク（University Hospital Medical Information Network : UMIN）に登録されている（ID 番号：UMIN000036244）。研究助成として、厚生労働省科学研究補助金（採択番号 2906081）を受け実施した。

（倫理面への配慮）

C. 研究結果

研究参加の流れ

研究参加の流れを図に示す（図 1）。5つの企業のうち 2,276 人からの AUDIT 回答結果があつた。これらの回答者のうち、505 人が 8 点以上のハイリスク飲酒者の判定となり、各事業所の健康管理担当者から研究参加について呼びかけを行った。研究参加の対象者の条件を確認した上で、380 人が口頭で研究参加の意向を示し、無作為に 3 群に割り付け、対面で研究参加の説明をし、最終的に 351 名からの参加同意を得た。この研究参加者は研究開始時点での対照群（リーフレット提供群）111 名、通常版介入群 128 名、5 分の短縮版介入群 112 名に割り付けられていた。半年後、1 年後の追跡時に各群で脱落が生じ、最終的に対照群 103 名、通常版介入群 122 名、短縮版介入群 108 名が 1 年後までの経過を追跡することが可能であった。

研究参加者の特徴

初回アンケートに回答が得られた研究参加者 351 名の割り付け群別の各質問項目の頻度、割合を表に示す。割り付け群による各項目の差はみられず、均等に割り付けられていた。対象者のほとんどが男性であり、50 歳代を中心であつた。既婚者が多く、仕事の種類で生産現場や技能職に従事していると答えた者が 6 割以上であった。AUDIT 点数では 14 点以上と答えた者が 3 割程度存在した。週に 5 日以上飲酒すると答えた

た者は 7 割、過去 30 日以内の機会大量飲酒も 7 割を超えていた。全体の 4 割程度が現在喫煙していると答えた。

介入半年後の効果量の群間比較

初めに、ITT 分析による結果を示す。介入前の 3 群の週飲酒量 g/週（標準偏差）は対照群 260.1g/週（188.0）、通常版介入群 286.2 g/週（211.4）、短縮版介入群 257.4 g/週（155.6）であり、半年後では対照群 273.6 g/週（205.3）、通常版介入群 250.8 g/週（176.7）、短縮版介入群 266.1 g/週（175.2）と通常版介入群は他の群に比べ少なかった。メインアウトカムである半年後の 1 週間当たりの飲酒量の変化（半年後時点の週飲酒量ひく初回の週飲酒量）では、対照群 13.5 g/週（171.1）増、通常版介入群 35.4 g/週（170.0）減、短縮版介入群 8.6 g/週（134.6）増の変化がみられ、一元配置分散分析では 3 群の平均値の差は有意であった。多重検定を考慮し、有意確率を Bonferroni 補正した結果は $p=0.057$ であり統計学的に有意ではなかった。また、半年後の飲酒量の変化について、追跡からの脱落者を除外して分析したところ、通常版介入群 37.1 g/週（170.0）減となり、一元配置分散分析で $p=0.031$ 、Bonferroni 補正した結果は $p=0.055$ となつたが統計学的に有意ではなかった。

介入 1 年後の効果量の群間比較

ITT 分析による結果を示すと、1 年後の 1 週間当たりの飲酒量の変化量（1 年後時点の週飲酒量ひく初回の週飲酒量）は、対照群 13.4 g/週（157.3）減、通常版介入群 29.2 g/週（219.0）減、短縮版介入群 5.9 g/週（157.9）増の変化がみられた。一元配置分散分析で 3 群の平均値の差を検定したが、 $p=0.332$ と統計学的に有意ではなかった。また、追跡からの脱落者を除外して分析したところ、通常版介入群 30.9 g/週（224.2）減とであったが、一元配置分散分析で $p=0.27$ と、統計学的な有意差はみられなかつた。

た。

割り付け群別の飲酒量変化者の割合

いずれの項目においても通常版介入群で飲酒量の減少を認めた者の割合が多く、次いで短縮版介入群、対照群であった。通常版介入群では、半年時点で 40g/週以上減酒したものが 4 割、一年時点でも 4 割、20g/週の減酒を認めた者は 5 割近くに上った。いずれも 40g/週減少が 33.6%、20g/週減少が 40.6% であった。

割り付け群別の飲酒頻度の変化

週に 5 日以上飲酒するものの割合は通常版介入群で経過とともに減少を認めた。短縮版介入群では半年時点で割合が減ったが、一年時点では再び増え、対照群では半年後増えて、一年時点で急な減少がみられた。週 3 日以上飲酒するものの割合も同じような傾向がみられた。30 日以内機会大量飲酒するものの割合はいずれの群でも半年、一年と経時的に減少傾向を認めた。

飲酒量が減少したもの特性

いずれの指標をアウトカムと見なして分析した場合でも、通常版介入群では減酒したものの割合が高かった。年代においては一貫性がみられず、婚姻状況も既婚と未婚で大きな差はなかった。年収で 600 万円未満と回答したもの、仕事の種類が事務職、K6 の質問項目で高得点 13 点以上（高度の不安やうつがみられる）で、いずれのアウトカムにおいても減酒したものの割合が高かった。運動量の多いものは減酒したものの割合が低い傾向がみられた。

飲酒量の変化を従属変数とした重回帰分析

半年後の飲酒量の変化を従属変数とすると、関連要因を調整後も通常版介入を受けた者は、対照群と比べて平均で 52.7 g/週の飲酒量の減少を認めており、統計学的に有意であった ($p=0.03$)。1 年後の飲酒量の変化を従属変数とすると、目的変数の数が少なくなり、介入パタ

ーンによる飲酒量の変化は統計学的に有意ではなかった。

減酒ありを従属変数としたロジスティック回帰分析

半年後飲酒量 40g/週減少を従属変数とする、各説明変数を調整後も通常版介入群であることは、飲酒量の減少に有意な関係を認めた (OR 1.92, 95%CI: 1.03, 3.56)。他の変数で半年後の減酒に有意な関連がみられる項目はなかつた。1 年後の飲酒量 40g/週減少を従属変数とすると、介入パターンに加えいずれの説明変数も有意な関連は見られなかつた。さらに、半年後と 1 年後がともに飲酒量 40g/週減少を従属変数とすると、通常版介入群で有意な関連がみられ (OR 2.44, 95%CI: 1.22, 4.90)、半年後と 1 年後がともに飲酒量 20g/週減少を従属変数とした分析でも通常版介入群であることは統計学的に有意に飲酒量減少の有無と関連がみられた (OR 2.11, 95%CI: 1.11, 4.01)。

追跡後の評価時期による層別分析

1 年後の評価が 2020 年 7 月末までの集団において、1 年後の飲酒量 40g/週減少を従属変数としたロジスティック回帰分析では、介入パターンと減酒ありに有意な関連がみられた。(短縮版で OR 2.73, 95%CI: 1.02, 7.30、通常版で OR 3.44, 95%CI: 1.33, 8.86)。一方で、1 年後の評価が 2020 年 8 月以降の集団でのロジスティック回帰分析では、介入パターンの違いは有意な関連を示さなかつた。しかし、年齢が 50 歳以上であることと、年収が 600 万円未満であることは 1 年後時点での減酒の有無に有意な関連がみられた。

D. 考察

今回の研究は、日本における初めてのスクリーニングを伴った、産業保健現場における比較的大規模な SBI の効果検証のための研究である。無作為割り付けを行った 380 名のうち 351 名か

ら研究参加の同意が得られた。各群の基本属性を比較すると、対象者は3群に均等に割り付けられており、年齢は40から50歳代を中心で、ほとんどは男性で、8割以上が週3日以上飲酒し、7割以上が30日以内に機会大量飲酒を経験していた。

主要評価項目である半年後の1週間当たりの飲酒量の変化（半年後時点の週飲酒量ひく初回の週飲酒量）の群間比較では、通常版介入群において35.4g/週の飲酒量の減少がみられた。一元配置分散分析において3群の平均値の差は有意であったが、多重検定を考慮し、有意確率をBonferroni補正した結果では統計学的な有意差は示されなかった。1年後の1週間当たりの飲酒量の変化（1年後時点の週飲酒量ひく初回の週飲酒量）は、通常版介入群で29.2g/週の減少がみられたが、対照群でも飲酒量の減少がみられ、3群の平均値の差は統計学的に有意ではなかった。介入効果はプライマリケア現場での介入研究を分析したコクランレビュー[5]に相当する結果であったが、サンプルサイズの影響のためか統計学的な有意差は示されなかった。統計学的に有意でなかったものの、通常版介入群の飲酒量は初回と比較して減少しており、1年後の時点でも効果が持続している可能性を示している。

飲酒頻度の多い者、機会大量飲酒の者の割合は、研究参加者全体で減少を認め、特に通常版介入群では順調に低下した。

飲酒量の変化に関する要因を探索する目的で行った重回帰分析の結果、半年後の飲酒量の変化には通常版介入群が有意な関連を示した。しかし、1年後の飲酒量の変化には有意な関連がみられなかった。同様に、減酒をアウトカムとしたロジスティック回帰分析では、通常版介入群であることは、半年後減酒、半年後と1年後ともに減酒といったアウトカムと有意な関連がみられた。オッズ比を参考にすると、通常版介

入群では対照群に比べ約2倍減酒の結果がみられやすいことを示しており、今回の介入効果を支持する結果である。介入の割り付けを考慮した上で減酒と関連の見られる統計学的に有意な説明要因はなかった。

さらに、1年後の分析では、介入の効果が示されず、対照群において1年後の時点で不自然な飲酒量や飲酒頻度の減少を認めていた。2020年6月頃から新型コロナウイルス流行の波が起り、都市閉鎖や外出自粛が叫ばれ、島根県では感染者数が少なかったものの、行政機関は外食利用などを控えるよう住民に要請していた。そのため、1年後の評価時期による介入効果の違いが考えられた。評価時期の違いによる層別のロジスティック回帰分析の結果を見ると、2020年7月末までの群では関連要因の調整後も通常版介入群、短縮版介入群であることは有意に減酒と関連していた。1年後の評価が8月以降の群では、介入群であることに有意な関連がみられなかった。このことは、新型コロナウイルス流行により、飲み会が減ったり、仕事のペースが変わったことにより対象者全体に飲酒行動の変化が起こった可能性がある。こうした影響が、1年後の介入効果が十分に出なかった原因であるかもしれない。8月以降に1年後の評価を行った群において、年齢が50歳以上であることと、年収が600万円未満であることが減酒と関連していたことを鑑みると、新型コロナウイルス流行における社会の変化の影響を受けやすい集団の特性を表している可能性がある。

研究の強みとして、今回の職域での介入研究は研究参加者の追跡が行いやすく、脱落率が低かったことが大きな利点である。一方で、弱点としてはアルコール消費量の測定方法の妥当性に限界があることである。比較的頻繁に用いられている方法(Timeline Follow-back procedure[42])とも異なり自己記入式調査票で測定を行った。自己記入式調査はカウンセリン

グの介入者が行う対面による聞き取りよりも回答結果に影響を受けていくのではという議論がある[23]。2つ目に、SBIに関するすべての研究において言えることであるが、研究参加者の盲検化ができないことがあげられる。介入結果の評価盲検化を行った。第3は外的妥当性であり、研究参加者の所属地域や業態が限られていた。しかし、全国での一般化可能性を考慮すると大規模で全国規模の介入試験が必要であり、現時点で現実的ではない。

E. 結論

今回の研究結果では、サンプルサイズの不足により有意差は示せなかつたが、産業保健現場での保健師によるSBIが医療現場と遜色のない一定の効果を示すという可能性を強く示唆している。また、今回効果が実証されたのは15分程度の従来通りの介入方法であった。1年後の評価には新型コロナウイルス流行の影響も考えられ、十分な介入効果が示されなかつたが、1年後においても一定の効果が持続している可能性が示された。

産業保健現場でのSBIの実施は、プライマリケアなどの医療現場よりも若年の集団に対して予防効果が期待され、企業や地域の健康指標を改善し、アルコールによる害を減らす重要な戦略の一つとなる可能性がある。将来的には、介入方法の改善、現場での実現可能性の検証、健診結果を介入の評価項目とした介入効果の根拠を示すことで、SBI実践の場を広げ、アルコールによる疾病負荷の軽減に貢献したいと考える。

楽しく健康に、仕事に役立つお酒の飲み方

適量のお酒は、人間関係の潤滑油になったりリラックスできたりと、私たちの生活を豊かにしてくれます。一緒にお酒を飲むことで、親睦が深まり仕事のプラスにもなります。

その一方で、飲み過ぎは健康に悪いだけでなく、問題やトラブルの原因となります。二日酔いで仕事に悪影響がたり、健康診断の数値が悪化したり、余計なことを言って相手を怒らせてしまったり・・・そんな経験はありませんでしたか？

良い酒飲みはお酒をたくさん飲む人ではなく、お酒と上手に付き合える人です。これから説明するポイントを参考にして、楽しく健康的な飲みかたをマスターしていきましょう。

■ 1 お酒の良いこと・悪いことを考えてみましょう

お酒を飲んでよかったこと

お酒を飲んで悪かったこと

■ 2 あなたの飲み方は危険？

あなたの飲み方に関する質問（AUDIT）の合計点数は、同世代100人中で何位になるでしょうか？全国調査の値と比較し、右の“危ない飲み方ランキング”に書き込みましょう。

年齢(歳)	男性			女性			
	20-39	40-59	60-74	年齢(歳)	20-39	40-59	60-74
上位3位	20点	20点	20点	上位3位	10点	6点	4点
5位	18点	18点	16点	5位	8点	5点	4点
10位	15点	16点	13点	10位	6点	4点	3点
20位	11点	12点	10点	20位	4点	3点	2点
30位	8点	10点	7点	30位	3点	2点	1点
40位	6点	8点	6点	40位	2点	2点	0点
50位	4点	7点	4点	50位	2点	1点	0点
60位	3点	5点	4点	60位	1点	1点	0点
70位	2点	4点	2点	70位	0点	0点	0点

■ 3 健診結果を振り返ってみましょう

健診の結果を右の“私の検査結果”に書き込みましょう。

【肝機能検査（AST, ALT, γGTP）】

飲酒によってダメージを受けやすいのが肝臓です。過度の飲酒によって脂肪肝になります。そのまま飲酒を続けると脂肪肝はアルコール性肝炎となり、やがて肝硬変に進行します。お酒と関係の深い肝機能検査の結果を右の“私の検査結果”に書き込みましょう。γGTPは全国調査の結果とも比較しましょう。

【高血圧】

高血圧の基準は140/90です。上の血圧（収縮期血圧）、下の血圧（拡張期血圧）のいずれか、あるいはどちらも基準値以上にしておくと、脳血管障害（脳卒中）、心臓病、腎臓病のリスクが明らかに高くなることが知られています。

高血圧の原因のひとつに飲酒があります。飲酒が高血圧を引き起こす原因として、中枢神経や自律神経への影響、血管へのダメージ、ホルモンバランスへの影響が考えられています。一方で、約2ドリンクの節酒により、収縮期血圧（=上の血圧）が4mmHg程度下がることがわかっています。あなたの血圧はお酒の飲み方を変えることで改善するかもしれません。

私の検査結果

AST : ____IU/L (正常値 5-40)
 ALT : ____IU/L (正常値 5-35)
 γGTP: ____IU/L (正常値 0-35)
 γGTPランキング: 100名中 ____位
 血圧: ____ / ____ (基準値140/80)

男性	γGTP(IU/l)	女性
13位	80以上	3位
16位	70-79	4位
20位	60-69	5位
26位	50-59	8位
35位	40-49	12位
51位	30-39	20位
77位	20-29	40位
99位	10-19	96位
100位	10未満	100位

■ 4 ついついお酒を飲んでしまうのはどんな時？

どのくらいの量のお酒を飲むのかということは、時間帯や場所、その時の気分、一緒にいる人などの周囲の状況で変わってきます。ついついお酒を多く飲んでしまう状況のパターンを把握して、量を増やさないでうまく乗り越える対処法を考えてみましょう。

リストの中から多く飲んでしまう状況にチェック✓
 その状況に対して量を増やさないための対処法を考えてみましょう。

- | | |
|---|---|
| <input type="checkbox"/> 仕事の付き合いでの宴会 | <input type="checkbox"/> 暑いとき |
| <input type="checkbox"/> 営業や接待 | <input type="checkbox"/> 嬉しいとき、気分が高揚しているとき |
| <input type="checkbox"/> 展示会、セミナー、勉強会 | <input type="checkbox"/> 親戚とのつきあい |
| <input type="checkbox"/> 上司、取引先などからすすめられたとき | <input type="checkbox"/> ひとりで食事しているとき |
| <input type="checkbox"/> 仲間や仕事場の同僚との宴会 | <input type="checkbox"/> ひまなとき |
| <input type="checkbox"/> 善式、法事、結婚式などの行事 | <input type="checkbox"/> ゆううつなとき、イライラしているとき |

■ 5 目標を立てましょう

実現できそうな目標を、なるべく具体的に決めて誰かに宣言しましょう。例えば

- ・生中2杯+日本酒1杯まで
- ・1週間にビールレギュラー缶10缶までにする。
- ・翌朝アルコールチェックで呼気アルコール〇
- ・休肝日を週に2日以上

などです。

私の目標は _____
 _____ です。
 この目標を達成することを _____ に誓います。

■ 6 目標達成のための対処法を考えましょう

目標達成のための対処法

- | | |
|--|--|
| <input type="checkbox"/> 飲み会ではまず食事でおなか一杯にする | <input type="checkbox"/> 何杯飲んだか数えながら飲む |
| <input type="checkbox"/> 飲む量の上限を決める | <input type="checkbox"/> 0時過ぎたらソフトドリンク |
| <input type="checkbox"/> ノンアルコールビールも一緒に飲む | <input type="checkbox"/> 飲み会以外では飲まない |
| <input type="checkbox"/> 3次会にはいかない | <input type="checkbox"/> 翌朝はアルコールチェック |
| <input type="checkbox"/> 飲みすぎてしまう相手を避ける | <input type="checkbox"/> 一口飲んだらコップを置く |
| <input type="checkbox"/> 一定期間禁酒する | <input type="checkbox"/> 目標達成時のご褒美を決める |
| <input type="checkbox"/> 歌いまくって席にいる時間を減らす | <input type="checkbox"/> 1か月の飲み代を計算する |
| <input type="checkbox"/> 外出時に持っていくお金を減らす | <input type="checkbox"/> お酒以外の楽しみを増やす |
| <input type="checkbox"/> 飲みすぎで会社に呼び出されたと言う | <input type="checkbox"/> 血圧や体重のことを記録する |

ドリンク換算表 < 1ドリンク=純アルコール10g(12.5ml) >
 ビールレギュラー缶：1.4ドリンク、ビール中ジョッキ：1.3ドリンク
 ビールロング缶：2.0ドリンク、日本酒1合：2.2ドリンク

② 飲酒運転

- ✓ 飲酒の運転への影響は、男性、若年者でより強い
- ✓ 飲酒運転では事故被害者の重症度がより高くなる
- ✓ 普段飲んでいる人でも、お酒の運転への影響は、飲まない人と変わらない。
- ✓ 顔が赤くなりにくい人でも、お酒の運転への影響は、赤くなりやすい人と変わらない

③ 肝障害

④ AUDIT以外の飲みすぎの指標

- ①大量飲酒の経験がある
アメリカの問題飲酒者のスクリーニングテストの基準です。

基準値：
「過去1年間に、1日でビールレギュラー缶（または中ジョッキ）で男性5本、女性4本以上飲酒」

- ②一日平均の飲酒量が多い
厚生労働省が定めた生活習慣病のリスクとなる飲酒量です。

基準値：
「一日平均で男性ビールロング缶2本、女性ロング缶1本以上飲酒」

⑤ 酒類のドリンク換算表

お酒に含まれるアルコール濃度（度数）は、酒の種類によって異なるため、どのくらい飲んだか客観的に評価することが困難です。そこで飲酒量を評価するときにはドリンクという単位を使って、飲んだお酒の量を純アルコールに換算して計算します。

- ・1ドリンクは純アルコールで10グラムです。
- ・純アルコールの計算の仕方は、「飲んだ酒の量（mL）× 酒のアルコール濃度 × 0.8」です。
- ・酒のアルコール濃度は、度数を100で割ったものです。また、0.8はアルコールの比重です。
- ・アルコールの分解にかかる時間は、1時間あたり0.4ドリンク（4グラム）です。

	ドリンク数	ビール換算(mL)
ビール	コップ1杯	0.7 180
	中瓶	2.0 500
	大瓶	2.5 633
	レギュラー缶	1.4 350
	ロング缶	2.0 500
	中ジョッキ	1.3 320
日本酒 (15%)	1合(180ml)	2.2 540
	お猪口 (30ml)	0.4 90
焼酎 (20%)	1合	2.9 720
	1合	3.6 900
チューハイ (7%)	レギュラー缶	2.0 490
	ロング缶	2.8 700
	中ジョッキ	1.8 448
ワイン (12%)	ワイングラス (120ml)	1.2 288
	ハーフボトル (375ml)	3.6 900
	フルボトル (750ml)	7.2 1,800
ウィスキー (40%)	シングル水割り（原酒で30ml）	1.0 240
	ダブル水割り（原酒で60ml）	2.0 480
	ボトル1本 (720ml)	23.0 5,760
梅酒 (13%)	1合 (180ml)	1.9 486
	お猪口 (30ml)	0.3 78

豆知識1

飲む量をちょっと減らすだけでも、大きな効果があります。
毎日飲む量をビールロング缶1缶分減らすと1か月の摂取カロリーが脂肪1kg分減ります。

豆知識2

運動の後のビールは格別ですが、お酒を飲むと排尿やアルコールの分解のため水が使われ脱水になります。飲んだ後は寝る前に水分を補給しましょう。

豆知識3

お酒の分解過程で実は尿酸が作られてしまいます。尿酸値が高い方は、プリン体フリーのお酒にするほかに、お酒の量自体も減らしましょう。

被保険者番号 : _____

2018年10月

生活や健康に関する調査（企業版 初回自記式記入票）

「厚生労働科学研究費補助金（循環器疾患・糖尿病等生活習慣病対策総合研究事業）

飲酒や喫煙等の実態調査と生活習慣病予防のための減酒の効果的な介入方法の開発に関する調査」研究班

- このアンケートは事業所と鳥取大学が協働して健康づくりに取り組むにあたっての研究に関するものです。
- お答えは、あてはまる回答についている数字を〇でかこんでください。「その他」にあてはまる場合は、数字を〇でかこみ、() 内に具体的な内容を記入してください。() 内に書ききれない時は欄外にご記入ください。
- 〇をつける質問は、基本的に回答は1つです。2つ以上回答してもよい場合は、(〇はいくつでも) などと表示しておりますので、それぞれ表示にしたがってお答えください。
- ご記入が終わりましたら、記入もれがないかご確認いただき、訪問した保健師・管理栄養士にお渡しください。

気にさわる質問があったり、同じような内容の質問をくりかえしたり、あなたご自身にあまり関係のない内容をたずねたりしますが、学術研究調査という目的をご理解いただき、最後まで1問ずつお答えください。

【質問A. 以下は飲酒習慣に関する質問です】

問 A1. あなたは、平均するとお酒をどれくらいの頻度で飲みますか。（〇は1つ）

- | | |
|------------|------------------|
| 1 毎日2回以上 | 6 1ヶ月に2～3日 |
| 2 毎日1回 | 7 1ヶ月に1日 |
| 3 1週間に5～6日 | 8 1年間に6～11日 |
| 4 1週間に3～4日 | 9 1年間に1～5日 |
| 5 1週間に1～2日 | 10 過去1年間は飲酒していない |

問 A2. この30日間で、1度に純アルコールで60グラム以上相当のお酒を飲んだことはありますか。

純アルコールで60グラム以上相当とは、ビールの500ミリリットル缶で3本以上、日本酒で3合以上、焼酎で300mL(1.7合)以上です。記入例の表を参考にお答えください。（〇は1つ）

- | | | |
|---------------|---------------|------------|
| 1
飲んだことがある | 2
飲んだことはない | 3
わからない |
|---------------|---------------|------------|

問 A3. ふだんお酒を飲むときには、1日にどれくらい飲みますか。記入例の表を参考に種類別にお答えください。

種類	《記入例》 (例) 酷ハイ	(1)ビール・発泡酒	(2)日本酒	(3)焼酎	(4)酔ハイ類
量 (具体的)	500ml 3本				
よく飲む銘柄の度数	9% ストロングゼロ				

種類	(5)カクテル類	(6)ワイン	(7)ウイスキー類	(8)その他(梅酒等)
量 (具体的)				
よく飲む銘柄の度数				

問 A4. あなたは、過去1年間に、飲酒に関係なく、自分自身のケガや病気のために、医療機関の救急外来を受診したことがありますか。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A5. あなたは、過去1年間に、飲酒に関係した自分自身のケガや病気のために、医療機関の救急外来を受診したことがありますか。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A6. あなたは、過去1年間に、飲酒に関係なく、交通事故を起こしたことがありますか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A7. あなたは、過去1年間に、飲んでいる時に、誤ってけがをしたことがありますか。
けがとは、激しく転んだり、ひどく切ってしまったたり、骨折したり、交通事故にあう、というような
ことです。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A8. あなたは、過去1年間に、お酒の飲みすぎのために、職場を休んだことがありますか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上	6 職場に 行っていない
---------------	-------------------------	---------	-----------	-----------	--------------------

問 A9. あなたは、過去1年間に、お酒を飲んで自動車等を飲酒運転しましたか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上	6 運転を することがない
---------------	-------------------------	---------	-----------	-----------	---------------------

【質問B. 以下は睡眠に関する質問です。】

問B1. この30日間に、あなたの睡眠の質を全体としてどのように評価しますか。(○は1つ)

1 非常によい	2 かなりよい	3 かなり悪い	4 非常に悪い
-------------------	-------------------	-------------------	-------------------

問B2. この30日間に、1日平均して何時間くらい眠りましたか。(○は1つ)

1 5時間 未満	2 5時間以上 ～6時間未満	3 6時間以上 ～7時間未満	4 7時間以上 ～8時間未満	5 8時間以上 ～9時間未満	6 9時間 以上
-----------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------

問B3. この30日間に、夜、寝床につく平均時間は何時くらいでしたか。(○は1つ)

1 午後10時 より前	2 午後10以降 ～11時より前	3 午後11以降 ～12時より前	4 午前0以降 ～1時より前	5 午前1以降 ～2時より前	6 午前2時 以降
--------------------------	-------------------------------	-------------------------------	-----------------------------	-----------------------------	------------------------

問B4. この30日間に、夜、眠りにつきにくい(なかなか眠れない)ことはありましたか。(○は1つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問B5. この30日間に、朝、起床する平均時間は何時くらいでしたか。(○は1つ)

1 午前5時 より前	2 午前5以降 ～6時より前	3 午前6以降 ～7時より前	4 午前7以降 ～8時より前	5 午前8以降 ～9時より前	6 午前9時 以降
-------------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------------	------------------------

問B6. この30日間に、夜、いったん眠ってから目がさめましたか(夜中に目がさめましたか)。(○は1つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問B7. この30日間に、朝早く(明け方)目がさめてしまい、もう一度眠ることが難しいことがありましたか。
(○は1つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問B8. この30日間に、あなたは、眠りを助けるために睡眠剤や安定剤を使いましたか。(○は1つ)

1 まったくない	2 1週間に1日未満	3 1週間に1～2日	4 1週間に3日以上
--------------------	----------------------	----------------------	----------------------

【問C. 以下はあなたご自身の心の状態に関する質問です。】

この一か月（30日間）にどのくらいの頻度で次のことがありましたか。
もっとも当てはまる番号に○を付けて下さい。

(1) 神経過敏（ちょっとした事も気になる）に感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(2) 絶望的だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(3) そわそわ、落ち着かなく感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(4) 気分が沈み込んで、何が起こっても気が晴れないように感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(5) 何をするのも骨折り（おっくう）だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(6) 自分は価値のない人間だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

【質問D. 以下はあなたがご自身の健康をどのように考えておられるかに関する質問です】

問D1. 全体的にみて、過去1か月間のあなたの健康状態はいかがでしたか。（○は1つ）

1 最高に良い	2 とても良い	3 よい	4 あまりよくない	5 良くない	6 ぜんぜん良くない
-------------------	-------------------	----------------	---------------------	------------------	----------------------

問D2. 過去1か月間に、体を使う日常活動（歩いたり階段を上ったりなど）をすることが
身体的な理由でどのくらい妨げられましたか。（○は1つ）

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 体を使う日常活動 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	---------------------------------

問D3. 過去1か月間に、いつもの仕事（家事も含みます）をすることが
身体的な理由でどのくらい妨げられましたか。（○は1つ）

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 いつもの仕事 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	-------------------------------

問 D4. 過去 1か月間に体の痛みはどのくらいありましたか。(○は 1つ)

1 ぜんぜん なかった	2 かすかな 痛み	3 軽い痛み	4 中くらいの 痛み	5 強い痛み	6 非常に激しい 痛み
--------------------------	------------------------	------------------	-------------------------	------------------	--------------------------

問 D5. 過去 1か月間、どのくらい元気でしたか。(○は 1つ)

1 非常に 元気だった	2 かなり 元気だった	3 少し 元気だった	4 わずかに 元気だった	5 ぜんぜん 元気でなかつた
--------------------------	--------------------------	-------------------------	---------------------------	-----------------------------

問 D6. 過去 1か月間に、家族や友人とのふだんのつきあいが、身体的あるいは心理的な理由でどのくらい妨げられましたか。(○は 1つ)

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 つきあいが が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	------------------------------

問 D7. 過去 1か月間に、心理的な問題（不安を感じたり、気分が落ち込んだり、イライラしたり）に、どのくらい悩まされましたか。(○は 1つ)

1 ぜんぜん 悩まされなかつた	2 わずかに 悩まされた	3 少し 悩まされた	4 かなり 悩まされた	5 非常に 悩まされた
------------------------------	---------------------------	-------------------------	--------------------------	--------------------------

問 D8. 過去 1か月間に、日常行う活動（仕事、学校、家事などふだんの行動）が、心理的な理由でどのくらい妨げられましたか。(○は 1つ)

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 日常行う活動 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	-------------------------------

【質問 E. 以下はあなたの仕事のパフォーマンスに関する質問です】

※仕事のパフォーマンスとは仕事の成果やミスの少なさなどを意味します。

「0」が誰でもできるような最低の仕事のパフォーマンス、「10」がもっとも優れた労働者のパフォーマンスとして、0から10までの尺度上で評価してください。(番号のどれかに○)

問E1. あなたと似たような仕事（同じ職種・業務）をしている身の回りの労働者の普段のパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 最高のパフォーマンス

問E2. 過去1~2年のあなたの普段のパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 **最高のパフォーマンス**

問E3. 過去4週間(28日間)の間のあなたの総合的なパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 **最高のパフォーマンス**

【質問F. 以下はタバコに関する質問です】

問F1. あなたは、現在紙巻たばこを吸っていますか(今までのタイプのタバコ)。(○は一つ) 1 2

3 4

毎日吸う ときどき吸う やめた 以前から吸わない

平均すると1日に何本ぐらいたばこを吸っていますか。(注:「1本未満」の場合は「1本」と記入する)

--	--

本ぐらい

問F2. あなたは、今までに加熱式タバコを一口でも吸ったことがありますか。(加熱式たばことは、アイコス(iQOS)、グロー(glo)、プルームテック(Ploom TECH)のいずれかの商品です)(○は1つ)

1

吸ったことはない

2

吸ったことはあるが、
ここ1ヶ月は吸っていない

3

現在、吸っている

問F3. あなたは、今までに電子タバコを一口でも吸ったことがありますか。(電子タバコとは、フレヴォ(FLEVO)、ビタフル(VITAFUL)、エミリ(EMILI)、Dr. VAPE、C-Tec、eGo-AIOやiSTICKなどの商品のことです)(○は1つ)

1

吸ったことはない

2

吸ったことはあるが、
ここ1ヶ月は吸っていない

3

現在、吸っている

【質問 G. 以下はあなたの食生活に関する質問です】

問 G. あなたの食生活の状況についてあてはまる番号を○で囲んでください。

	毎日食べる	週6~4日は食べる	週1~3日は食べる	食べない
朝食は食べますか	4	3	2	1
昼食は食べますか	4	3	2	1
夕食は食べますか	4	3	2	1
間食（おやつ）は食べますか	4	3	2	1
夜食（夕食後の間食）は食べますか	4	3	2	1
ジュースや缶コーヒーなどの甘味飲料はどの程度飲みますか	4	3	2	1
カップ麺はどの程度食べますか	4	3	2	1
主食・主菜・副菜がそろった食事を食べますか	4	3	2	1
お肉を食べますか	4	3	2	1
魚を食べますか	4	3	2	1
色の濃い野菜（にんじん、カボチャ、ピーマンなど）を食べますか	4	3	2	1
色の薄い野菜（白菜、大根、キャベツ、玉ねぎなど）を食べますか	4	3	2	1
乳製品（ヨーグルト・チーズなど）を食べますか	4	3	2	1
果物を食べますか	4	3	2	1
漬物を食べますか	4	3	2	1
塩蔵品（塩鮭、たらこ、塩辛、佃煮など）を食べますか	4	3	2	1

問G1. あなたは、普段エナジードリンクを飲みますか（レッドブル、モンスター エナジー、ライシン、ミラクル エナジー、サバイバー エナジー、エナジードライ、シャーク、ファイテン等）。

1 飲んだことがない	2 飲んだことがあるが この1か月は飲んでいない	3 現在時々飲む (週1~2日)	4 現在よく飲む (週3~4日)	5 ほぼ毎日飲む (週5日以上)
---------------	--------------------------------	------------------------	------------------------	------------------------

問G2. あなたは、この半年の間にお酒をエナジードリンクで割って飲みましたか？

1 どちらも飲まない	2 やったことがない	3 時々する	4 いつもする
---------------	---------------	-----------	------------

【質問 H. 以下はあなたの運動習慣に関する質問です】

以下の質問には、1回につき少なくとも10分間以上続けて行う身体活動についてのみ考えて、お答えください。
※仕事中に行う運動も含みます

問 H1. 平均的な一週間では、強い身体活動（重い荷物の運搬、自転車で坂道を上ること、ジョギング、

テニスのシングルスなど) を行う日は何日ありますか?

1 ある (週

--	--

日)

2 ない (⇒問 H3 へ)

問 H2. 強い身体活動を行う日は、通常、1 日合計してどのくらいの時間そのような活動を行いますか?

1 日

--	--

時間

--	--

分

問 H3. 平均的な1週間では、中等度の身体活動（軽い荷物の運搬、子供との鬼ごっこ、ゆっくり泳ぐこと、テニスのダブルス、カートを使わないゴルフなど）を行う日は何日ありますか?

歩行やウォーキングは含めないでお答えください。

1 ある (週

--	--

日)

2 ない (⇒問 H5 へ)

問 H4. 中等度の身体活動を行う日は、通常、1 日合計してどのくらいの時間そのような活動を行いますか?

1 日

--	--

時間

--	--

分

問 H5. 平均的な1週間では、10分以上続けて歩くことは何日ありますか?

ここで、歩くとは仕事や日常生活で歩くこと、ある場所からある場所へ移動すること、あるいは趣味や運動としてのウォーキング、散歩などすべてを含みます。

1 ある (週

--	--

日)

2 ない (⇒問 H7 へ)

問 H6. そのような日には、通常、一日合計してどのくらいの時間歩きますか?

1 日

--	--

時間

--	--

分

問 H7. 最後の質問は、毎日座ったり寝転んだりして過ごしている時間（仕事中、自宅で、勉強中、余暇時間など）についてです。すなわち、机に向かったり、友人とおしゃべりをしたり、読書をしたり、座ったり、寝転んでテレビを見たり、といったすべての時間を含みます。なお、睡眠時間は含めないでください。

平日には、通常、一日合計してどのくらいの時間座ったり寝転んだりして過ごしますか?

1 日

--	--

時間

--	--

分

【質問 I. 以下はあなたがこれまでにかかったことのあるご病気についての質問です】

問 I1. 以下の内でこれまでにかかったことのある病気はありますか。(○はいくつでも)

-
- | | | | |
|-----------------|-----------------|-----------------|----------------------------|
| 1
うつ病 | 2
不眠症 | 3
神経症 | 4
その他の
メンタル疾患 |
|-----------------|-----------------|-----------------|----------------------------|
-

問 I2. 以下の中で現在も治療中の病気はありますか。(○はいくつでも)

- | | | | |
|-----------------|-----------------|-----------------|----------------------------|
| 1
うつ病 | 2
不眠症 | 3
神経症 | 4
その他の
メンタル疾患 |
|-----------------|-----------------|-----------------|----------------------------|
-

問 I3. 以下の中で現在内服している薬はありますか。(○はいくつでも)

- | | | | |
|-----------------|------------------|------------------|-------------------------------|
| 1
睡眠薬 | 2
抗不安薬 | 3
抗うつ薬 | 4
その他精神科や心療内科からの処方薬 |
|-----------------|------------------|------------------|-------------------------------|
-

【質問 J. 最後にあなた自身のことについてお聞かせください。】

問J1. あなたは小学校から始まり、学校に通算で何年行きましたか。

--	--

年

00 学校には行かなかった

問J2. あなたは現在、結婚されていますか。(○は1つ)

- 1** 配偶者と同居している
 - 2** 配偶者と別居している（単身赴任を含める）
 - 3** 内縁関係（配偶者のような関係）
 - 4** 死別した
 - 5** 離婚した
 - 6** 未婚（結婚したことがない）
 - 7** わからない
-

問 J3. 現在、一緒に住んでいるご家族（親族以外の同居人も含む）はあなたを含めて何人ですか。

--	--

人

（一人の場合は、問 J5 へ）

問 J4. 現在、一緒に住んでいる方々をすべてあげてください。(○はいくつでも)

- | | | |
|------------------|-----------------|---------------------|
| 1 配偶者 | 4 孫 | 7 その他（具体的に) |
| 2 子ども | 5 父母 | 8 わからない |
| 3 子どもの配偶者 | 6 配偶者の父母 | |
-

問 J5. 現在のあなたの職業をお聞かせください。

- | | |
|--------------------------|--------------|
| 1 自営・自由業者（家族従業を含む） | 4 家事専業（専業主婦） |
| 2 勤め（正社員・正職員） | 5 無職（失業中を含む） |
| 3 勤め（契約・派遣・嘱託・パート・アルバイト） | 6 その他（ ） |
-

【問 J5 で、4 家事専業、5 無職、以外を答えた方に】

問 J6. あなたはどのような種類の仕事をしていますか。（注：「その他」の場合はできるだけ具体的に記入して下さい）

- | | |
|--|---|
| 1 専門・技術職………（医師、看護師、弁護士、教師、技術者、デザイナーなど専門的知識・技術を要するもの） | 4 |
| 2 管理職……………（企業・官公庁における課長職以上、議員、経営者など） | |
| 3 事務職……………（企業・官公庁における一般事務、経理、内勤の営業など） | |
| 4 販売職……………（小売・卸売店主、店員、不動産売買、保険外交、外勤のセールスなど） | |
| 5 サービス職……………（理・美容師、料理人、ウェイトレス、ホームヘルパー、ビル清掃など） | |
| 6 生産現場・技能職…（製品製造・組立、自動車整備、建設作業員、大工、電気工事、農水産物加工など） | |
| 7 運輸……………（バス・トラック・タクシー運転手、船員、郵便配達、通信士など） | |
| 8 保安……………（警察官、消防官、自衛官、警備員など） | |
| 9 農・林・漁業……………（農作物生産、家畜飼養、森林培養、水産物養殖、漁獲など） | |
| 10 その他（具体的に | |
| 11 わからない | ） |
-

問 J7. あなたは現在、交代制勤務をしていますか。

- | | | | |
|---------|---------|---------|--------|
| 1 いつも夜勤 | 2 交替制勤務 | 3 交替制勤務 | 4 昼勤のみ |
|---------|---------|---------|--------|
-

問 J8. このアンケートに答えた日付の前の月の残業時間は約何時間でしたか。

約月

--	--	--

 時間 00 わからない

問 J9. あなた世帯の税込み年収は、だいたいどのくらいですか。

（年金などを受けている場合やアルバイト収入がある場合は、その額も含んだ合計額でお答えください。）

- | | | |
|---------------|-------------------|-------------------|
| 1 100万円未満 | 5 400～600万円未満 | 9 1,200～1,500万円未満 |
| 2 100～200万円未満 | 6 600～800万円未満 | 10 1,500万円以上 |
| 3 200～300万円未満 | 7 800～1,000万円未満 | 11 収入なし |
| 4 300～400万円未満 | 8 1,000～1,200万円未満 | 12 わからない |
-
-

質問は以上です。ご協力いただき誠にありがとうございました。

生活や健康に関する調査（企業版 半年後自記式記入票）

「厚生労働科学研究費補助金（循環器疾患・糖尿病等生活習慣病対策総合研究事業）

飲酒や喫煙等の実態調査と生活習慣病予防のための減酒の効果的な介入方法の開発に関する調査」研究班

- ・このアンケートは事業所と鳥取大学が協働して健康づくりに取り組むにあたっての研究に関するものです。
- ・お答えは、あてはまる回答についている数字を〇でかこんでください。「その他」にあてはまる場合は、数字を〇でかこみ、() 内に具体的な内容を記入してください。() 内に書ききれない時は欄外にご記入ください。
- ・〇をつける質問は、基本的に回答は1つです。2つ以上回答してもよい場合は、(〇はいくつでも) などと表示しておりますので、それぞれ表示にしたがってお答えください。
- ・ご記入が終わりましたら、記入もれがないかご確認いただき、ご返送ください。

気にさわる質問があったり、同じような内容の質問をくりかえしたり、あなたご自身にあまり関係のない内容をたずねたりしますが、学術研究調査という目的をご理解いただき、最後まで1問ずつお答えください。

【質問A. 以下は飲酒習慣に関する質問です】

問 A1. あなたは、平均するとお酒をどれくらいの頻度で飲みますか。（〇は1つ）

- | | |
|------------|------------------|
| 1 毎日2回以上 | 6 1カ月に2～3日 |
| 2 毎日1回 | 7 1カ月に1日 |
| 3 1週間に5～6日 | 8 1年間に6～11日 |
| 4 1週間に3～4日 | 9 1年間に1～5日 |
| 5 1週間に1～2日 | 10 過去1年間は飲酒していない |

問 A2. この30日間で、1度に純アルコールで60グラム以上相当のお酒を飲んだことはありますか。

純アルコールで60グラム以上相当とは、ビールの500ミリリットル缶で3本以上、日本酒で3合以上、焼酎で300mL(1.7合)以上です。記入例の表を参考に種類別にお答えください。（〇は1つ）

- | | | |
|---------------|---------------|------------|
| 1
飲んだことがある | 2
飲んだことはない | 3
わからない |
|---------------|---------------|------------|

問 A3. ふだんお酒を飲むときには、1日にどれくらい飲みますか。記入例の表を参考に種類別にお答えください。

種類	『記入例』 (例) 酷ハイ	(1)ビール・発泡酒	(2)日本酒	(3)焼酎	(4)酔ハイ類
量 (具体的に)	500ml 3本				
よく飲む銘柄の度数	9% ストロングゼロ				

種類	(5)カクテル類	(6)ワイン	(7)ウイスキー類	(8)その他(梅酒等)
量 (具体的に)				
よく飲む銘柄の度数				

問 A4. あなたは、過去1年間に、飲酒に関係なく、自分自身のケガや病気のために、医療機関の救急外来を受診したことがありますか。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A5. あなたは、過去1年間に、飲酒に関係した自分自身のケガや病気のために、医療機関の救急外来を受診したことがありますか。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A6. あなたは、過去1年間に、飲酒に関係なく、交通事故を起こしたことがありますか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A7. あなたは、過去1年間に、飲んでいる時に、誤ってけがをしたことがありますか。
けがとは、激しく転んだり、ひどく切ってしまったたり、骨折したり、交通事故にあう、というような
ことです。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A8. あなたは、過去1年間に、お酒の飲みすぎのために、職場を休んだことがありますか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上	6 職場に 行っていない
---------------	-------------------------	---------	-----------	-----------	--------------------

問 A9. あなたは、過去1年間に、お酒を飲んで自動車等を飲酒運転しましたか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上	6 運転を することがない
---------------	-------------------------	---------	-----------	-----------	---------------------

問 A10. あなたの、この半年間の飲酒行動の変化で当てはまると思うものを教えてください。(○はいくつでも)

- 1 変化なし 2 量が増えた 4 回数(頻度)が増えた 6 酒を断った
3 量が減った 5 回数(頻度)が減った
-

【質問B. 以下は睡眠に関する質問です。】

問 B1. この 30 日間に、あなたの睡眠の質を全体としてどのように評価しますか。(○は 1 つ)

1 非常によい	2 かなりよい	3 かなり悪い	4 非常に悪い
-------------------	-------------------	-------------------	-------------------

問 B2. この 30 日間に、1 日平均して何時間くらい眠りましたか。(○は 1 つ)

1 5時間 未満	2 5時間以上 ～6時間未満	3 6時間以上 ～7時間未満	4 7時間以上 ～8時間未満	5 8時間以上 ～9時間未満	6 9時間 以上
-----------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------

問 B3. この 30 日間に、夜、寝床につく平均時間は何時くらいでしたか。(○は 1 つ)

1 午後 10 時 より前	2 午後 10 以降 ～11 時より前	3 午後 11 以降 ～12 時より前	4 午前 0 以降 ～1 時より前	5 午前 1 以降 ～2 時より前	6 午前 2 時 以降
----------------------------	----------------------------------	----------------------------------	--------------------------------	--------------------------------	--------------------------

問 B4. この 30 日間に、夜、眠りにつきにくい（なかなか眠れない）ことはありましたか。(○は 1 つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問 B5. この 30 日間に、朝、起床する平均時間は何時くらいでしたか。(○は 1 つ)

1 午前 5 時 より前	2 午前 5 以降 ～6 時より前	3 午前 6 以降 ～7 時より前	4 午前 7 以降 ～8 時より前	5 午前 8 以降 ～9 時より前	6 午前 9 時 以降
---------------------------	--------------------------------	--------------------------------	--------------------------------	--------------------------------	--------------------------

問 B6. この 30 日間に、夜、いったん眠ってから目がさめましたか（夜中に目がさめましたか）。(○は 1 つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問 B7. この 30 日間に、朝早く（明け方）目がさめてしまい、もう一度眠ることが難しいことがありましたか。
(○は 1 つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問 B8. この 30 日間に、あなたは、眠りを助けるために睡眠剤や安定剤を使いましたか。(○は 1 つ)

1 まったくない	2 1 週間に 1 日未満	3 1 週間に 1 ～ 2 日	4 1 週間に 3 日以上
--------------------	-------------------------	---------------------------	-------------------------

【問C. 以下はあなたご自身の心の状態に関する質問です。】

この一か月（30日間）にどのくらいの頻度で次のことがありましたか。
もっとも当てはまる番号に○を付けて下さい。

(1) 神経過敏（ちょっとした事も気になる）に感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(2) 絶望的だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(3) そわそわ、落ち着かなく感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(4) 気分が沈み込んで、何が起こっても気が晴れないように感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(5) 何をするのも骨折り（おっくう）だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(6) 自分は価値のない人間だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

【質問D. 以下はあなたがご自身の健康をどのように考えておられるかに関する質問です】

問D1. 全体的にみて、過去1か月間のあなたの健康状態はいかがでしたか。（○は1つ）

1 最高に良い	2 とても良い	3 よい	4 あまりよくない	5 良くない	6 ぜんぜん良くない
-------------------	-------------------	----------------	---------------------	------------------	----------------------

問D2. 過去1か月間に、体を使う日常活動（歩いたり階段を上ったりなど）をすることが
身体的な理由でどのくらい妨げられましたか。（○は1つ）

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 体を使う日常活動 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	---------------------------------

問D3. 過去1か月間に、いつもの仕事（家事も含みます）をすることが
身体的な理由でどのくらい妨げられましたか。（○は1つ）

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 いつもの仕事 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	-------------------------------

問 D4. 過去 1か月間に体の痛みはどのくらいありましたか。(○は 1つ)

1 ぜんぜん なかった	2 かすかな 痛み	3 軽い痛み	4 中くらいの 痛み	5 強い痛み	6 非常に激しい 痛み
--------------------------	------------------------	------------------	-------------------------	------------------	--------------------------

問 D5. 過去 1か月間、どのくらい元気でしたか。(○は 1つ)

1 非常に 元気だった	2 かなり 元気だった	3 少し 元気だった	4 わずかに 元気だった	5 ぜんぜん 元気でなかつた
--------------------------	--------------------------	-------------------------	---------------------------	-----------------------------

問 D6. 過去 1か月間に、家族や友人とのふだんのつきあいが、身体的あるいは心理的な理由でどのくらい妨げられましたか。(○は 1つ)

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 つきあいが が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	------------------------------

問 D7. 過去 1か月間に、心理的な問題（不安を感じたり、気分が落ち込んだり、イライラしたり）に、どのくらい悩まされましたか。(○は 1つ)

1 ぜんぜん 悩まされなかつた	2 わずかに 悩まされた	3 少し 悩まされた	4 かなり 悩まされた	5 非常に 悩まされた
------------------------------	---------------------------	-------------------------	--------------------------	--------------------------

問 D8. 過去 1か月間に、日常行う活動（仕事、学校、家事などふだんの行動）が、心理的な理由でどのくらい妨げられましたか。(○は 1つ)

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 日常行う活動 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	-------------------------------

【質問 E. 以下はあなたの仕事のパフォーマンスに関する質問です】

※仕事のパフォーマンスとは仕事の成果やミスの少なさなどを意味します。

「0」が誰でもできるような最低の仕事のパフォーマンス、「10」がもっとも優れた労働者のパフォーマンスとして、0から10までの尺度上で評価してください。(番号のどれかに○)

問E1. あなたと似たような仕事（同じ職種・業務）をしている身の回りの労働者の普段のパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 最高のパフォーマンス

問E2. 過去1~2年のあなたの普段のパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 **最高のパフォーマンス**

問E3. 過去4週間(28日間)の間のあなたの総合的なパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 **最高のパフォーマンス**

【質問F. 以下はタバコに関する質問です】

問F1. あなたは、現在紙巻たばこを吸っていますか(今までのタイプのタバコ)。(○は一つ)

1 毎日吸う	2 ときどき吸う	3 やめた	4 以前から吸わない
------------------	--------------------	-----------------	----------------------

↓

平均すると1日に何本ぐらいたばこを吸っていますか。(注:「1本未満」の場合は「1本」と記入する)

--	--

本ぐらい

問F2. あなたは、今までに加熱式タバコを一口でも吸ったことがありますか。(加熱式たばことは、アイコス(iQOS)、グロー(glo)、プルームテック(Ploom TECH)のいずれかの商品です)(○は1つ)

1 吸ったことはない	2 吸ったことはあるが、 ここ1ヶ月は吸っていない	3 現在、吸っている
----------------------	--	----------------------

問F3. あなたは、今までに電子タバコを一口でも吸ったことがありますか。(電子タバコとは、フレヴォ(FLEVO)、ビタフル(VITAFUL)、エミリ(EMILI)、Dr. VAPE、C-Tec、eGo-AIOやiSTICKなどの商品のことです)(○は1つ)

1 吸ったことはない	2 吸ったことはあるが、 ここ1ヶ月は吸っていない	3 現在、吸っている
----------------------	--	----------------------

問F4. あなたの、半年間の喫煙行動の変化で当てはまると思うものを教えてください。(○はいくつでも)

- | | | |
|--------|-------------------------|-------------------------|
| 1 変化なし | 2 紙巻きたばこの本数増えた | 6 完全に加熱式たばこに切り替えた |
| | 3 紙巻きたばこの本数減った | 7 完全に電子タバコに切り替えた |
| | 4 紙巻きたばこの頻度が増えた | 8 電子タバコと紙巻きたばこを使うようにした |
| | 5 紙巻きたばこの頻度が減った | 9 加熱式タバコと紙巻きたばこを使うようにした |
| | 10 紙巻、加熱、電子タバコの全てを使っている | |

【質問 G. 以下はあなたの食生活に関する質問です】

問 G. あなたの食生活の状況についてあてはまる番号を○で囲んでください。

	毎日食べる	週 6~4 日は食べる	週 1~3 日は食べる	食べない
朝食は食べますか	4	3	2	1
昼食は食べますか	4	3	2	1
夕食は食べますか	4	3	2	1
間食（おやつ）は食べますか	4	3	2	1
夜食（夕食後の間食）は食べますか	4	3	2	1
ジュースや缶コーヒーなどの甘味飲料はどの程度飲みますか	4	3	2	1
カップ麺はどの程度食べますか	4	3	2	1
主食・主菜・副菜がそろった食事を食べますか	4	3	2	1
お肉を食べますか	4	3	2	1
魚を食べますか	4	3	2	1
色の濃い野菜（にんじん、カボチャ、ピーマンなど）を食べますか	4	3	2	1
色の薄い野菜（白菜、大根、キャベツ、玉ねぎなど）を食べますか	4	3	2	1
乳製品（ヨーグルト・チーズなど）を食べますか	4	3	2	1
果物を食べますか	4	3	2	1
漬物を食べますか	4	3	2	1
塩蔵品（塩鮭、たらこ、塩辛、佃煮など）を食べますか	4	3	2	1

問G1. あなたは、普段エナジードリンクを飲みますか（レッドブル、モンスターエナジー、ライジン、ミラクルエナジー、サバイバーエナジー、エナジードライ、シャーク、ファイテン等）。

1 飲んだことがない	2 飲んだことあるが この1か月は飲んでいない	3 現在時々飲む (週1-2日)	4 現在よく飲む (週3-4日)	5 ほぼ毎日飲む (週5日以上)

問G2. あなたは、この半年の間にお酒をエナジードリンクで割って飲みましたか？

1 どちらも飲まない	2 やったことがない	3 時々する	4 いつもする

【質問 H. 以下はあなたの運動習慣に関する質問です】

以下の質問には、1回につき少なくとも10分間以上続けて行う身体活動についてのみ考えて、お答えください。
※仕事中に行う運動も含みます

問 H1. 平均的な一週間では、強い身体活動（重い荷物の運搬、自転車で坂道を上ること、ジョギング、

テニスのシングルスなど) を行う日は何日ありますか?

1 ある (週

--	--

 日)

2 ない (⇒問 H3 へ)

問 H2. 強い身体活動を行う日は、通常、1日合計してどのくらいの時間そのような活動を行いますか?

1 日

--	--

 時間

--	--

 分

問 H3. 平均的な1週間では、中等度の身体活動（軽い荷物の運搬、子供との鬼ごっこ、ゆっくり泳ぐこと、テニスのダブルス、カートを使わないゴルフなど）を行う日は何日ありますか?
歩行やウォーキングは含めないでお答えください。

1 ある (週

--	--

 日)

2 ない (⇒問 H5 へ)

問 H4. 中等度の身体活動を行う日は、通常、1日合計してどのくらいの時間そのような活動を行いますか?

1 日

--	--

 時間

--	--

 分

問 H5. 平均的な1週間では、10分以上続けて歩くことは何日ありますか?
ここで、歩くとは仕事や日常生活で歩くこと、ある場所からある場所へ移動すること、あるいは趣味や運動としてのウォーキング、散歩などすべてを含みます。

1 ある (週

--	--

 日)

2 ない (⇒問 H7 へ)

問 H6. そのような日には、通常、一日合計してどのくらいの時間歩きますか?

1 日

--	--

 時間

--	--

 分

問 H7. 最後の質問は、毎日座ったり寝転んだりして過ごしている時間（仕事中、自宅で、勉強中、余暇時間など）についてです。すなわち、机に向かったり、友人とおしゃべりをしたり、読書をしたり、座ったり、寝転んでテレビを見たり、といったすべての時間を含みます。なお、睡眠時間は含めないでください。
平日には、通常、一日合計してどのくらいの時間座ったり寝転んだりして過ごしますか?

1 日

--	--

 時間

--	--

 分

【質問 J. 最後にあなた自身のことについてお聞かせください。】

問 J7. あなたは現在、交代制勤務をしていますか。

-
- | | | | |
|-------------------|---------------------|---------------------|------------------|
| 1
いつも夜勤 | 2
3 交替制勤務 | 3
2 交替制勤務 | 4
昼勤のみ |
|-------------------|---------------------|---------------------|------------------|
-

問 J8. このアンケートに答えた日付の前の月の残業時間は約何時間でしたか。

(残業がなければ 0 をご記入ください)

約月	<input type="text"/> <input type="text"/> <input type="text"/>	時間	00 わからない
----	--	----	----------

質問は以上です。ご協力いただき誠にありがとうございました。

被保険者番号 : _____

2018年10月

生活や健康に関する調査（企業版 1年後自記式記入票）

「厚生労働科学研究費補助金（循環器疾患・糖尿病等生活習慣病対策総合研究事業）

飲酒や喫煙等の実態調査と生活習慣病予防のための減酒の効果的な介入方法の開発に関する調査」研究班

- このアンケートは事業所と鳥取大学が協働して健康づくりに取り組むにあたっての研究に関するものです。
- お答えは、あてはまる回答についている数字を〇でかこんでください。「その他」にあてはまる場合は、数字を〇でかこみ、() 内に具体的な内容を記入してください。() 内に書ききれない時は欄外にご記入ください。
- 〇をつける質問は、基本的に回答は1つです。2つ以上回答してもよい場合は、(〇はいくつでも) などと表示しておりますので、それぞれ表示にしたがってお答えください。
- ご記入が終わりましたら、記入もれがないかご確認いただき、ご返送ください。

気にさわる質問があったり、同じような内容の質問をくりかえしたり、あなたご自身にあまり関係のない内容をたずねたりしますが、学術研究調査という目的をご理解いただき、最後まで1問ずつお答えください。

【質問A. 以下は飲酒習慣に関する質問です】

問 A1. あなたは、平均するとお酒をどれくらいの頻度で飲みますか。(〇は1つ)

- | | |
|------------|------------------|
| 1 毎日2回以上 | 6 1ヶ月に2～3日 |
| 2 毎日1回 | 7 1ヶ月に1日 |
| 3 1週間に5～6日 | 8 1年間に6～11日 |
| 4 1週間に3～4日 | 9 1年間に1～5日 |
| 5 1週間に1～2日 | 10 過去1年間は飲酒していない |

問 A2. この30日間で、1度に純アルコールで60グラム以上相当のお酒を飲んだことはありますか。

純アルコールで60グラム以上相当とは、ビールの500ミリリットル缶で3本以上、日本酒で3合以上、焼酎で300mL(1.7合)以上です。記入例の表を参考に種類別にお答えください。(〇は1つ)

- | | | |
|---------------|---------------|------------|
| 1
飲んだことがある | 2
飲んだことはない | 3
わからない |
|---------------|---------------|------------|

問 A3. ふだんお酒を飲むときには、1日にどれくらい飲みますか。記入例の表を参考に種類別にお答えください。

種類	《記入例》 (例) 酷ハイ	(1)ビール・発泡酒	(2)日本酒	(3)焼酎	(4)酔ハイ類
量 (具体的に)	500ml 3本				
よく飲む銘柄の度数	9% ストロングゼロ				

種類	(5)カクテル類	(6)ワイン	(7)ウイスキー類	(8)その他(梅酒等)
量 (具体的に)				
よく飲む銘柄の度数				

問 A4. あなたは、過去1年間に、飲酒に関係なく、自分自身のケガや病気のために、医療機関の救急外来を受診したことがありますか。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A5. あなたは、過去1年間に、飲酒に関係した自分自身のケガや病気のために、医療機関の救急外来を受診したことがありますか。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A6. あなたは、過去1年間に、飲酒に関係なく、交通事故を起こしたことがありますか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A7. あなたは、過去1年間に、飲んでいる時に、誤ってけがをしたことがありますか。
けがとは、激しく転んだり、ひどく切ってしまったたり、骨折したり、交通事故にあう、というような
ことです。あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上
---------------	-------------------------	---------	-----------	-----------

問 A8. あなたは、過去1年間に、お酒の飲みすぎのために、職場を休んだことがありますか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上	6 職場に 行っていない
---------------	-------------------------	---------	-----------	-----------	--------------------

問 A9. あなたは、過去1年間に、お酒を飲んで自動車等を飲酒運転しましたか。
あれば、その回数を教えてください。(○は1つ)

1 今まで一度もない	2 過去にはあるが ここ1年はない	3 1回	4 2~4回	5 5回以上	6 運転を することがない
---------------	-------------------------	---------	-----------	-----------	---------------------

問 A10. あなたの、この半年間の飲酒行動の変化で当てはまると思うものを教えてください。(○はいくつでも)

- 1 変化なし 2 量が増えた 4 回数(頻度)が増えた 6 酒を断った
3 量が減った 5 回数(頻度)が減った

【質問B. 以下は睡眠に関する質問です。】

問 B1. この 30 日間に、あなたの睡眠の質を全体としてどのように評価しますか。(○は 1 つ)

1 非常によい	2 かなりよい	3 かなり悪い	4 非常に悪い
-------------------	-------------------	-------------------	-------------------

問 B2. この 30 日間に、1 日平均して何時間くらい眠りましたか。(○は 1 つ)

1 5時間 未満	2 5時間以上 ～6時間未満	3 6時間以上 ～7時間未満	4 7時間以上 ～8時間未満	5 8時間以上 ～9時間未満	6 9時間 以上
-----------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------------	-----------------------

問 B3. この 30 日間に、夜、寝床につく平均時間は何時くらいでしたか。(○は 1 つ)

1 午後 10 時 より前	2 午後 10 以降 ～11 時より前	3 午後 11 以降 ～12 時より前	4 午前 0 以降 ～1 時より前	5 午前 1 以降 ～2 時より前	6 午前 2 時 以降
----------------------------	----------------------------------	----------------------------------	--------------------------------	--------------------------------	--------------------------

問 B4. この 30 日間に、夜、眠りにつきにくい（なかなか眠れない）ことはありましたか。(○は 1 つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問 B5. この 30 日間に、朝、起床する平均時間は何時くらいでしたか。(○は 1 つ)

1 午前 5 時 より前	2 午前 5 以降 ～6 時より前	3 午前 6 以降 ～7 時より前	4 午前 7 以降 ～8 時より前	5 午前 8 以降 ～9 時より前	6 午前 9 時 以降
---------------------------	--------------------------------	--------------------------------	--------------------------------	--------------------------------	--------------------------

問 B6. この 30 日間に、夜、いったん眠ってから目がさめましたか（夜中に目がさめましたか）。(○は 1 つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問 B7. この 30 日間に、朝早く（明け方）目がさめてしまい、もう一度眠ることが難しいことがありましたか。
(○は 1 つ)

1 まったく なかった	2 めったに なかった	3 時々 あった	4 しばしば あった	5 常に あった
--------------------------	--------------------------	-----------------------	-------------------------	-----------------------

問 B8. この 30 日間に、あなたは、眠りを助けるために睡眠剤や安定剤を使いましたか。(○は 1 つ)

1 まったくない	2 1 週間に 1 日未満	3 1 週間に 1 ～ 2 日	4 1 週間に 3 日以上
--------------------	-------------------------	---------------------------	-------------------------

【問C. 以下はあなたご自身の心の状態に関する質問です。】

この一か月（30日間）にどのくらいの頻度で次のことがありましたか。
もっとも当てはまる番号に○を付けて下さい。

(1) 神経過敏（ちょっとした事も気になる）に感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(2) 絶望的だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(3) そわそわ、落ち着かなく感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(4) 気分が沈み込んで、何が起こっても気が晴れないように感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(5) 何をするのも骨折り（おっくう）だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

(6) 自分は価値のない人間だと感じましたか

0 まったくない	1 すこしだけ	2 ときどき	3 たいてい	4 いつも
--------------------	-------------------	------------------	------------------	-----------------

【質問D. 以下はあなたがご自身の健康をどのように考えておられるかに関する質問です】

問D1. 全体的にみて、過去1か月間のあなたの健康状態はいかがでしたか。（○は1つ）

1 最高に良い	2 とても良い	3 よい	4 あまりよくない	5 良くない	6 ぜんぜん良くない
-------------------	-------------------	----------------	---------------------	------------------	----------------------

問D2. 過去1か月間に、体を使う日常活動（歩いたり階段を上ったりなど）をすることが
身体的な理由でどのくらい妨げられましたか。（○は1つ）

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 体を使う日常活動 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	---------------------------------

問D3. 過去1か月間に、いつもの仕事（家事も含みます）をすることが
身体的な理由でどのくらい妨げられましたか。（○は1つ）

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 いつもの仕事 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	-------------------------------

問 D4. 過去 1か月間に体の痛みはどのくらいありましたか。(○は 1つ)

1 ぜんぜん なかった	2 かすかな 痛み	3 軽い痛み	4 中くらいの 痛み	5 強い痛み	6 非常に激しい 痛み
--------------------------	------------------------	------------------	-------------------------	------------------	--------------------------

問 D5. 過去 1か月間、どのくらい元気でしたか。(○は 1つ)

1 非常に 元気だった	2 かなり 元気だった	3 少し 元気だった	4 わずかに 元気だった	5 ぜんぜん 元気でなかつた
--------------------------	--------------------------	-------------------------	---------------------------	-----------------------------

問 D6. 過去 1か月間に、家族や友人とのふだんのつきあいが、身体的あるいは心理的な理由でどのくらい妨げられましたか。(○は 1つ)

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 つきあいが が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	------------------------------

問 D7. 過去 1か月間に、心理的な問題（不安を感じたり、気分が落ち込んだり、イライラしたり）に、どのくらい悩まされましたか。(○は 1つ)

1 ぜんぜん 悩まされなかつた	2 わずかに 悩まされた	3 少し 悩まされた	4 かなり 悩まされた	5 非常に 悩まされた
------------------------------	---------------------------	-------------------------	--------------------------	--------------------------

問 D8. 過去 1か月間に、日常行う活動（仕事、学校、家事などふだんの行動）が、心理的な理由でどのくらい妨げられましたか。(○は 1つ)

1 ぜんぜん 妨げられなかつた	2 わずかに 妨げられた	3 少し 妨げられた	4 かなり 妨げられた	5 日常行う活動 が出来なかつた
------------------------------	---------------------------	-------------------------	--------------------------	-------------------------------

【質問 E. 以下はあなたの仕事のパフォーマンスに関する質問です】

※仕事のパフォーマンスとは仕事の成果やミスの少なさなどを意味します。

「0」が誰でもできるような最低の仕事のパフォーマンス、「10」がもっとも優れた労働者のパフォーマンスとして、0から10までの尺度上で評価してください。(番号のどれかに○)

問E1. あなたと似たような仕事（同じ職種・業務）をしている身の回りの労働者の普段のパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 最高のパフォーマンス

問E2. 過去1~2年のあなたの普段のパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 **最高のパフォーマンス**

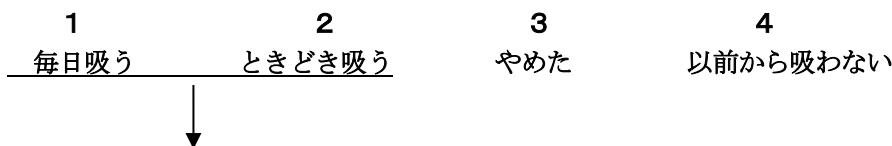

問E3. 過去4週間(28日間)の間のあなたの総合的なパフォーマンスをあなたはどのように評価しますか。

0から10までの尺度上で評価してください。

最低のパフォーマンス 0 1 2 3 4 5 6 7 8 9 10 **最高のパフォーマンス**

【質問F. 以下はタバコに関する質問です】

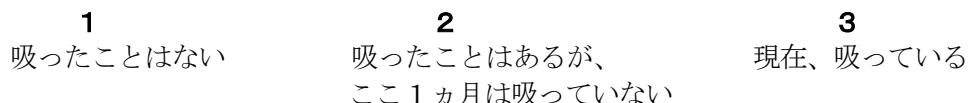

問F1. あなたは、現在紙巻たばこを吸っていますか(今までのタイプのタバコ)。(○は一つ)

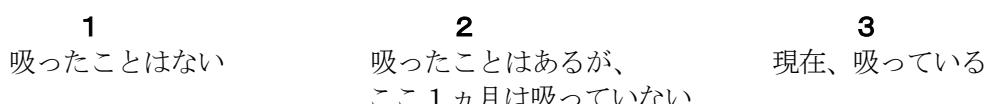

平均すると1日に何本ぐらいたばこを吸っていますか。(注:「1本未満」の場合は「1本」と記入する)

本ぐらい	

問F2. あなたは、今までに加熱式タバコを一口でも吸ったことがありますか。(加熱式たばことは、アイコス(iQOS)、グロー(glo)、プルームテック(Ploom TECH)のいずれかの商品です)(○は1つ)

問F3. あなたは、今までに電子タバコを一口でも吸ったことがありますか。(電子タバコとは、フレヴォ(FLEVO)、ビタフル(VITAFUL)、エミリ(EMILI)、Dr. VAPE、C-Tec、eGo-AIOやiSTICKなどの商品のことです)(○は1つ)

問F4. あなたの、半年間の喫煙行動の変化で当てはまると思うものを教えてください。(○はいくつでも)

- | | | |
|--------|-------------------------|------------------------|
| 1 変化なし | 2 紙巻きたばこの本数増えた | 6 完全に加熱式たばこに切り替えた |
| | 3 紙巻きたばこの本数減った | 7 完全に電子タバコに切り替えた |
| | 4 紙巻きたばこの頻度が増えた | 8 電子タバコと紙巻きたばこを使うようにした |
| | 5 紙巻きたばこの頻度が減った | 9 加熱式バコと紙巻きたばこを使うようにした |
| | 10 紙巻、加熱、電子タバコの全てを使っている | |

【質問 G. 以下はあなたの食生活に関する質問です】

問 G. あなたの食生活の状況についてあてはまる番号を○で囲んでください。

	毎日食べる	週 6~4 日は食べる	週 1~3 日は食べる	食べない
朝食は食べますか	4	3	2	1
昼食は食べますか	4	3	2	1
夕食は食べますか	4	3	2	1
間食（おやつ）は食べますか	4	3	2	1
夜食（夕食後の間食）は食べますか	4	3	2	1
ジュースや缶コーヒーなどの甘味飲料はどの程度飲みますか	4	3	2	1
カップ麺はどの程度食べますか	4	3	2	1
主食・主菜・副菜がそろった食事を食べますか	4	3	2	1
お肉を食べますか	4	3	2	1
魚を食べますか	4	3	2	1
色の濃い野菜（にんじん、カボチャ、ピーマンなど）を食べますか	4	3	2	1
色の薄い野菜（白菜、大根、キャベツ、玉ねぎなど）を食べますか	4	3	2	1
乳製品（ヨーグルト・チーズなど）を食べますか	4	3	2	1
果物を食べますか	4	3	2	1
漬物を食べますか	4	3	2	1
塩蔵品（塩鮭、たらこ、塩辛、佃煮など）を食べますか	4	3	2	1

問G1. あなたは、普段エナジードリンクを飲みますか（レッドブル、モンスターエナジー、ライジン、ミラクルエナジー、サバイバーエナジー、エナジードライ、シャーク、ファイテン等）。

1 飲んだことがない	2 飲んだことあるが この1か月は飲んでいない	3 現在時々飲む (週1-2日)	4 現在よく飲む (週3-4日)	5 ほぼ毎日飲む (週5日以上)

問G2. あなたは、この半年の間にお酒をエナジードリンクで割って飲みましたか？

1 どちらも飲まない	2 やったことがない	3 時々する	4 いつもする

【質問 H. 以下はあなたの運動習慣に関する質問です】

以下の質問には、1回につき少なくとも10分間以上続けて行う身体活動についてのみ考えて、お答えください。
※仕事中に行う運動も含みます

問 H1. 平均的な一週間では、強い身体活動（重い荷物の運搬、自転車で坂道を上ること、ジョギング、テニスのシングルスなど）を行う日は何日ありますか？

1 ある (週)

--	--

 日)

2 ない (⇒問 H3 へ)

問 H2. 強い身体活動を行う日は、通常、1日合計してどのくらいの時間そのような活動を行いますか？

1 日

--	--

 時間

--	--

 分

問 H3. 平均的な1週間では、中等度の身体活動（軽い荷物の運搬、子供との鬼ごっこ、ゆっくり泳ぐこと、テニスのダブルス、カートを使わないゴルフなど）を行う日は何日ありますか？

歩行やウォーキングは含めないでお答えください。

1 ある (週)

--	--

 日)

2 ない (⇒問 H5 へ)

問 H4. 中等度の身体活動を行う日は、通常、1日合計してどのくらいの時間そのような活動を行いますか？

1 日

--	--

 時間

--	--

 分

問 H5. 平均的な1週間では、10分以上続けて歩くことは何日ありますか？

ここで、歩くとは仕事や日常生活で歩くこと、ある場所からある場所へ移動すること、あるいは趣味や運動としてのウォーキング、散歩などすべてを含みます。

1 ある (週)

--	--

 日)

2 ない (⇒問 H7 へ)

問 H6. そのような日には、通常、一日合計してどのくらいの時間歩きますか？

1 日

--	--

 時間

--	--

 分

問 H7. 最後の質問は、毎日座ったり寝転んだりして過ごしている時間（仕事中、自宅で、勉強中、余暇時間など）についてです。すなわち、机に向かったり、友人とおしゃべりをしたり、読書をしたり、座ったり、寝転んでテレビを見たり、といったすべての時間を含みます。なお、睡眠時間は含めないでください。平日には、通常、一日合計してどのくらいの時間座ったり寝転んだりして過ごしますか？

1 日

--	--

 時間

--	--

 分

【質問 J. 最後にあなた自身のことについてお聞かせください。】

問 J7. あなたは現在、交代制勤務をしていますか。

- | | | | |
|-------------------|---------------------|---------------------|------------------|
| 1
いつも夜勤 | 2
3 交替制勤務 | 3
2 交替制勤務 | 4
昼勤のみ |
|-------------------|---------------------|---------------------|------------------|
-

問 J8. このアンケートに答えた日付の前の月の残業時間は約何時間でしたか。

約月

--	--	--

 時間 **00** わからない

質問は以上です。ご協力いただき誠にありがとうございました。

ABSTRACT

Background: This study aimed to identify increases in 100 % alcohol-related death (ARD) and any differences among prefectures between 1995–2016.

Methods: Data from the national death registry on 100 % ARDs between 1995–2016 were extracted. Age-standardized mortality rate (ASMR) of 100 % ARD by year, gender, and gender ratio were calculated. After dividing the period into 1995–2005 and 2006–2016, the ASMRs of 100 % ARDs were calculated by prefecture. Additionally, based on geographical area, municipality size, or annual alcohol sales per adult in each prefecture, prefectures were divided into groups and analysed.

Results: In total, 95,455 deaths were caused by 100 % ARD from 1995–2016. Men's ASMRs of 100 % ARD markedly increased from 4.0 per 100,000 in 1995 to 5.2 between 2010 and 2013, and gradually declined to 5.0 in 2016. Women's ASMRs increased steadily from 0.3 in 1995 to 0.8 in 2016. The gender ratio of ASMRs decreased from 13.3 in 1995 to 6.3 in 2016. The ASMR of one prefecture, which had reduced alcohol tax rates, was higher for both genders. Both men's and women's ASMRs were higher in the prefectures that had higher alcohol sales (6.3 [5.0–7.7] and 0.8 [0.6–1.1], respectively) compared to the prefectures that had lower alcohol sales (4.3 [4.0–4.7] p < 0.001 and 0.6 [0.5–0.6] p = 0.045, respectively).

Conclusions: The ASMR of 100 % ARD remained high for men and increased for women, and prefecture-level higher alcohol sales and lower tax rates correlated with the higher mortality rate. Increasing prices and taxes and reducing alcohol sales may contribute to a decrease in alcohol-related mortality.

1. Introduction

Alcohol-related deaths (ARD) are preventable. However, more than three million people died worldwide from harmful alcohol use in 2016 (World Health Organization, 2018b). According to trends in alcohol-related deaths in some countries between the 1990s and 2010s, the alcohol-related crude mortality rate decreased in areas and countries where it had been higher before the 1990s but increased in areas where it had been lower before the 1990s (Heale et al., 2002; Shipton et al., 2013; Kraus et al., 2015; Marmet et al., 2016; Ogeil et al., 2016; Piontek and Kraus, 2018). The age-standardized mortality rate (ASMR) is needed to compare annual changes. For the ASMR from alcohol-related disease, an increasing trend was reported in the United States, while in Japan,

trends in ARDs have not been revealed (Polednak, 2016; White et al., 2020).

There are two kinds of alcohol-related death: 'ARD' and '100 % ARD'. ARD includes all diseases and accidents related to alcohol, like breast cancer, suicide, and traffic accidents (Rehm et al., 2017). The ASMR of ARD in Japan in 2016 was estimated at 9.1 per 100,000 people (95 % confidence interval: 4.3–14.0) (GBD, 2016). However, ARD needs estimation and is not ideal for monitoring alcohol-related harm. Additionally, deaths partially caused by alcohol are affected by other risk factors, such as tobacco use. Conversely, 100 % ARD indicates diseases fully attributed to alcohol use, which are identified in the International Statistical Classification of Diseases and Related Health Problems, Tenth Edition (ICD-10) (World Health Organization, 2016; Rehm et al., 2017).

* Corresponding author at: Division of Environmental and Preventive Medicine, Department of Social Medicine, Faculty of Medicine, Tottori University, Nishi-cho 86, Yonago-shi, Tottori, 683-8503, Japan.

E-mail address: kinjo.aya@tottori-u.ac.jp (A. Kinjo).

The diseases included in 100 % ARD can be tabulated from the national death registry system, and trends in 100 % ARD can be made for each prefecture. Therefore, we adopted 100 % ARD as an indicator to monitor trends in the effects of alcohol use over time.

From 1950 to the 1990s in Japan, alcohol sales had increased steadily and peaked in 1999, and after that gradually decreased to around 90 % of the peak sales in 2018 (National Tax Agency, 2020). The sales of beer and alcopop accounted for around 25 % of total sales, respectively. The proportions of drinking patterns by gender in 2013 were: current drinkers: 82.9 % in men and 63.3 % in women; hazardous drinkers: 14.4 % in men and 5.7 % in women; and alcohol dependence: 1.9 % in men and 0.2 % in women (Osaki et al., 2016). The prevalence of alcohol dependence is low in comparison with Finland (4.5 %), France (3.3 %), and the United States (7.7 %) (World Health Organization, 2018b). The weakness of a Japanese alcohol policy has been identified (Higuchi et al., 2007). However, based on the World Health Organization's (WHO) publication of 'The Global Strategy to Reduce Harmful Use of Alcohol' in 2010, the Basic Act on Measures against Alcohol-related Harm was enacted in 2014, and a national action plan was launched in Japan (Ministry of Health, Labour and Welfare, 2013). Additionally, prefectures were required to provide their own action plans. For the purposes of developing national and local action plans, information is needed on trends in alcohol-related harm at the national and prefectural levels. However, Japan has not created a monitoring system, such as that in the United States, to track mortality rates related to excessive alcohol use (Polednak, 2016). Therefore, the other purpose of the current study was to reveal correlates by prefectures of 100 % ARD and explore the associated factors. To our knowledge, there is no research that has investigated the associated factors of 100 % ARD by prefecture level in

Japan. An ecological study in Great Britain reported that regions with higher alcohol consumption had higher alcohol-related mortality rates (Robinson et al., 2015). The current study investigated whether there is a positive relationship between 100 % ARD and alcohol sales in Japan, as well as the relation between 100 % ARD and geographical area or municipality size.

Additionally, recent population-based studies indicated that increased drinking among women is a public health concern in Japan, where heavy drinking among women was previously less common (Osaki et al., 2016). Therefore, the current study examined the trend of women's 100 % ARD and the ratio of men to women among heavy drinkers and ARDs in order to add further information about women's drinking habits.

2. Material and methods

2.1. Data source

Fig. 1 shows the data extraction flow for the current study. Based on Article 36 of the Statistics Acts in Japan, 24,038,889 death records from 1995 to 2016 were obtained from the Ministry of Health, Labour and Welfare. The data had been anonymised and included the year of death, age of death, prefecture where the deceased lived, and cause of death as identified using ICD-10 codes (World Health Organization, 2016). Excluding data with missing years of death and cases occurring before 1994, 24,033,863 cases between 1995 and 2016 were extracted. Of these, 95,491 cases of 100 % ARDs were identified by ICD-10 codes. After excluding data with missing ages, 95,455 cases were included in this study. Since this study used anonymous data, ethical review was not

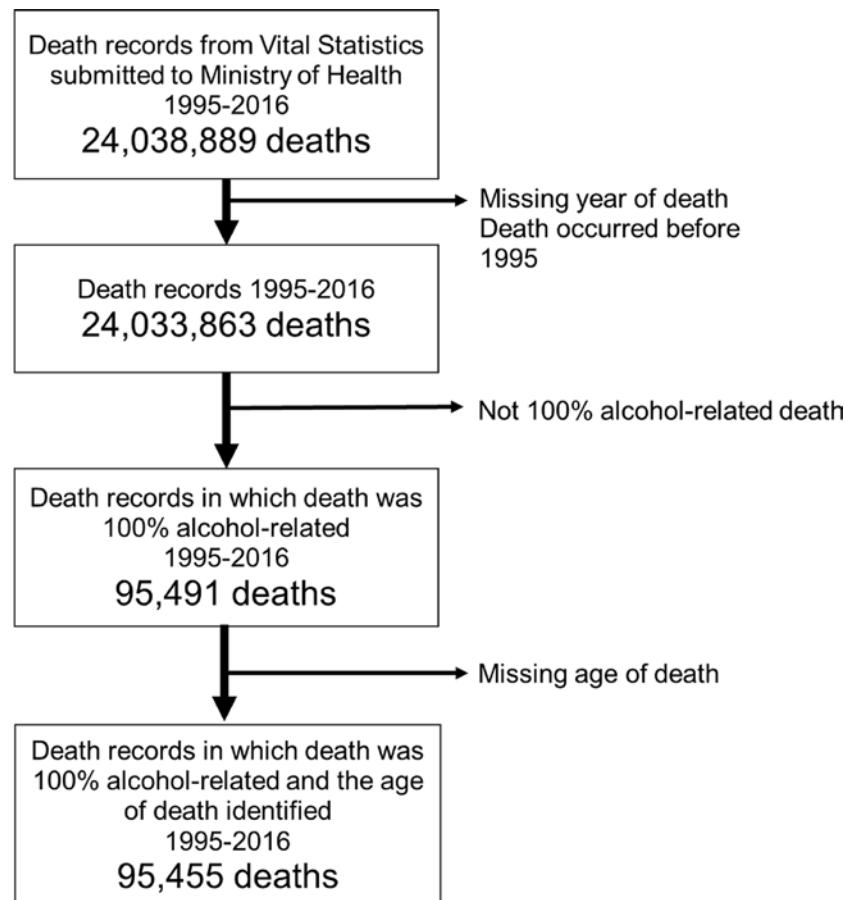

Fig. 1. Flowchart of data cleaning. There were 13 death records with addresses abroad and 356 death records with unknown addresses. Therefore, 95,076 death records were included when the number of deaths by prefecture was calculated.

required.

2.2. 100 % ARD

A 100 % alcohol-related disease was defined as a disease identified in the ICD-10 as alcohol-related, as shown in previous reports (Rehm et al., 2017) (Table S1). Additionally, 100 % ARDs were divided into five categories using ICD-10 codes: category F10, mental and behavioural disorders due to use of alcohol; category G, diseases of the nervous system due to alcohol; category I, alcoholic cardiomyopathy; category K, diseases of the digestive system due to alcohol; and category T, toxic effect of alcohol.

2.3. Recorded alcohol per capita

Annual alcohol consumption recorded per capita (APC; 15 years and older population; in litres of pure alcohol) from 1961 to 2015 was obtained from the WHO Global Information System on Alcohol and Health (GISAH) (World Health Organization, 2015). The original data are from World Drink Trends in 1961–1988 and from the National Tax Agency of Japan in 1989–2018. They are estimated based on sales data.

2.4. Geographical areas, municipality size, alcohol sales per adult in prefectures

Geographical areas were classified into six groups: North Japan (Hokkaido, etc.), Kanto (metropolitan area), Chubu (Nagoya, etc.), Kinki (Osaka, Kyoto, etc.), Chugoku/Shikoku, and Kyusyu (Fukuoka, Okinawa, etc.). According to municipality size, prefectures were divided into three categories: large (more than 2.3 million population during 1995–2015, 15 prefectures), medium (more than 1.26 million population during 1995–2015, 17 prefectures), and small (less than 1.26 million population during 1995–2015, 15 prefectures). Population data for each year were obtained from the Portal Site of Official Statistics of Japan (Ministry of Internal Affairs and Communications, 2008).

Alcohol sales per adult by prefecture were reported in the annual report, ‘Booklet of Alcoholic Beverages’, published by the National Tax Agency (National Tax Agency, 2005). The alcohol sales reflect the sum of alcoholic beverages sold in a prefecture, irrespective of alcohol concentration. The alcohol sales were divided by the adult population aged 20 and over in the prefecture. Based on the alcohol sales per adult by prefecture in 2005, prefectures were divided into three groups. The ‘high sales group’ included 12 prefectures with ≥ 90 L of alcohol sales per adult. The ‘moderate sales group’ included 17 prefectures with 80–90 litres of alcohol sales per adult. The ‘low sales group’ included 17 prefectures with <80 L of alcohol sales per adult. Okinawa, where the liquor tax was reduced, was not included in the list of prefectures in ‘Booklet of Alcoholic Beverages’, but the alcohol sales per adult was calculated as 91.8 L per adult from the following formula: the total alcohol sales in Okinawa from the regional annual reports divided by Okinawa’s population in 2005. Therefore, Okinawa was classified into a ‘high sales group’ group. Finally, prefectures were divided into three groups: high sales group, moderate sales group, and low sales group.

Since 1972, the liquor manufactured and sold in Okinawa has had a 65 % lower tax rate for traditional sake, ‘Awamori’, and an 80 % lower rate for beer and other liquors, compared to the tax rate for these products in other prefectures (Cabinet Office, 2017). The alcohol tax reduction for Okinawa was implemented to promote local industry. As a result, the tax on 1.8 L of Awamori with 30 % alcohol content would be 350 yen (US \$1 = 111.46 yen, US \$3.15) in Okinawa and 540 yen (US \$4.84) outside Okinawa. Additionally, the tax on 350 mL of beer would be 61.6 yen (US \$0.55) in Okinawa and 77 yen (US \$0.69) outside the prefecture.

2.5. Statistical analysis

The crude mortality rate for each year was calculated by dividing the number of deaths for that year by the total population. The ASMR for each year was calculated using the Japanese 1985 model population. The gender ratio was calculated by dividing the ASMR for men by the ASMR for women each year.

The 22-year period from 1995 to 2016 was divided into two periods—1995–2005 and 2006–2016—and the age distribution by causative disease and ASMR by prefecture were calculated for each period. When calculating the ASMR by prefecture, the numerator was the total number of 100 % ARD in the relevant prefecture during the period, and the denominator was the sum of the mid-year population by age group during the period. The rate of change between the two periods was expressed as a percentage by subtracting the 1995–2005 value from the 2006–2016 value, and then dividing by the 1995–2005 value. Kruskal–Wallis tests were used to assess differences between prefecture categories based on geographical areas, municipality sizes, and alcohol sales per prefecture. IBM SPSS 22.0 software was used for statistical analysis.

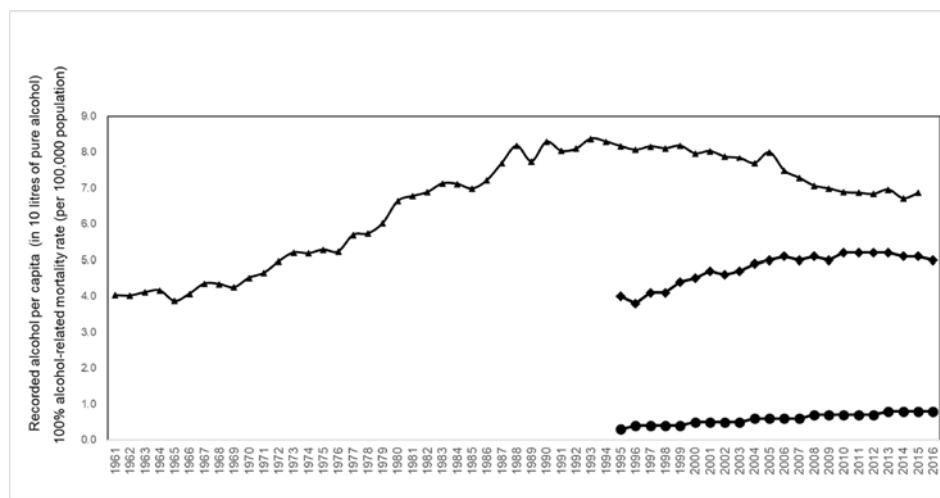

3. Results

Both men’s and women’s ASMRs for 100 % ARDs increased from 1995–2016. Fig. 2 shows recorded APC changes since 1961 and ASMRs of 100 % ARDs by gender since 1995. Recorded APC has increased since 1960, peaking at 8.37 L/year per capita in 1993, and falling to 6.86 L/year in 2015. The crude mortality rate for men increased steadily from 4.6 in 1995, and flattened thereafter, reaching 7.4 in 2011 and 7.5 in 2016. The ASMR for men (per 100,000 population) increased from 4.0 in 1995 to 5.2 between 2010 and 2013, and gradually declined to 5.0 in 2016. The crude mortality rate for women increased from 0.4 in 1995 to 1.0 in 2016. The ASMR for women also increased steadily, from 0.3 in 1995 to 0.8 in 2016.

Table 1 shows the number, ASMR, and gender ratio for 100 % ARDs each year. The ASMR for 100 % ARDs was 13.3 times higher for men than for women in 1995; however, the gender ratio gradually decreased, and in 2016 it was only 6.3 times higher for men than women.

In terms of total 100 % ARDs, the ages of death for both men and women were higher between 2006–2016 than 1995–2005, and women were 4–5 years younger than men (on average) at time of death. Table 2 shows descriptive statistics for age of death by cause of 100 % ARD. The average age of death by 100 % ARD was 57.9 (57.7–58.0) years old in 1995–2005 and 61.8 (61.7–61.9) years old in 2006–2016 among men, and 53.2 (52.8–53.6) years old in 1995–2005 and 56.2 (55.9–56.6) years old in 2006–2016 among women. When comparing the number of deaths between 1995–2005 and 2006–2016, the increase in the diseases of the digestive system due to alcohol was greater than the other categories. Deaths attributable to the toxic effect of alcohol increased significantly. For both men and women, the mean age of death was the lowest for the toxic effect of alcohol, followed by the mental and behavioural disorders due to use of alcohol.

The maps of prefectures with ASMR of 100 % ARDs in 2005–2016 by gender are shown in Fig. 3. The numerical value of ASMR of 100 % ARDs by prefecture and by gender are shown in Table S2. Compared to 1995–2005, the ASMR for 100 % ARDs between 2006–2016 was higher for men and women in all prefectures, except for two. For both 1995–2005 and 2006–2016, the prefecture with the highest male and female ASMRs (per 100,000 population) was Okinawa, with 12.8 and 2.0—more than twice the national average ASMR in Japan. Rates for men were highest in Tokyo after Okinawa, with 8.2 in 2006–2016. Four prefectures geographically located in the central area of Japan and were small or middle municipalities—Ishikawa, Fukui, Gifu, and Mie—had the lowest ASMRs between 2006 and 2016 for both sexes. The ASMRs for women were similar, except for the exceptionally high rates of Okinawa, Tokyo, and Osaka prefectures of 1.1.

▲Recorded alcohol per capita ■Men: age-standardized mortality rate ●Women: age-standardized mortality rate.

Table 1
Trends in numbers, age-standardised rates, and men:women ratio of 100 % alcohol-related deaths by gender, 1995–2016.

Year	Men		Women		Men/women ratio of age-adjusted mortality rate (per 100,000 population)
	Number of deaths	Age-standardised mortality rate (per 100,000 population)	Number of deaths	Age-standardised mortality rate (per 100,000 population)	
1995	2816	4.0	244	0.3	13.3
1996	2734	3.8	271	0.4	9.5
1997	2950	4.1	290	0.4	10.3
1998	3022	4.1	267	0.4	10.3
1999	3253	4.4	299	0.4	11.0
2000	3397	4.5	338	0.5	9.0
2001	3578	4.7	342	0.5	9.4
2002	3541	4.6	364	0.5	9.2
2003	3717	4.7	341	0.5	9.4
2004	3875	4.9	407	0.6	8.2
2005	4068	5.0	449	0.6	8.3
2006	4147	5.1	446	0.6	8.5
2007	4147	5.0	483	0.6	8.3
2008	4211	5.1	498	0.7	7.3
2009	4177	5.0	497	0.7	7.1
2010	4447	5.2	537	0.7	7.4
2011	4587	5.2	549	0.7	7.4
2012	4563	5.2	560	0.7	7.4
2013	4623	5.2	613	0.8	6.5
2014	4567	5.1	660	0.8	6.4
2015	4621	5.1	652	0.8	6.4
2016	4624	5.0	673	0.8	6.3

Age-adjusted rate was adjusted by 1985 standard population of Japan.

Alcohol sales per adult and reduced tax rates were related to the higher ASMRs of 100 % ARDs. Fig. 4 shows a boxplot comparing prefectures' ASMRs by geographical area, municipality size, and alcohol sales per adult. Data by geographical area showed men had significantly higher ASMRs for 100 % alcohol-related deaths in Kyushu and Chugoku/Shikoku prefectures ($p = 0.032$); however, women had no significant differences. No differences due to municipality size were noted. In terms of alcohol sales per adult, ASMRs due to deaths from 100 % ARD in both sexes were significantly higher among those from the high sales group. Rates in Okinawa, which was classified into the high sales group, were far higher than the others for both men and women. Results from Kruskal-Wallis tests are shown in Table S3.

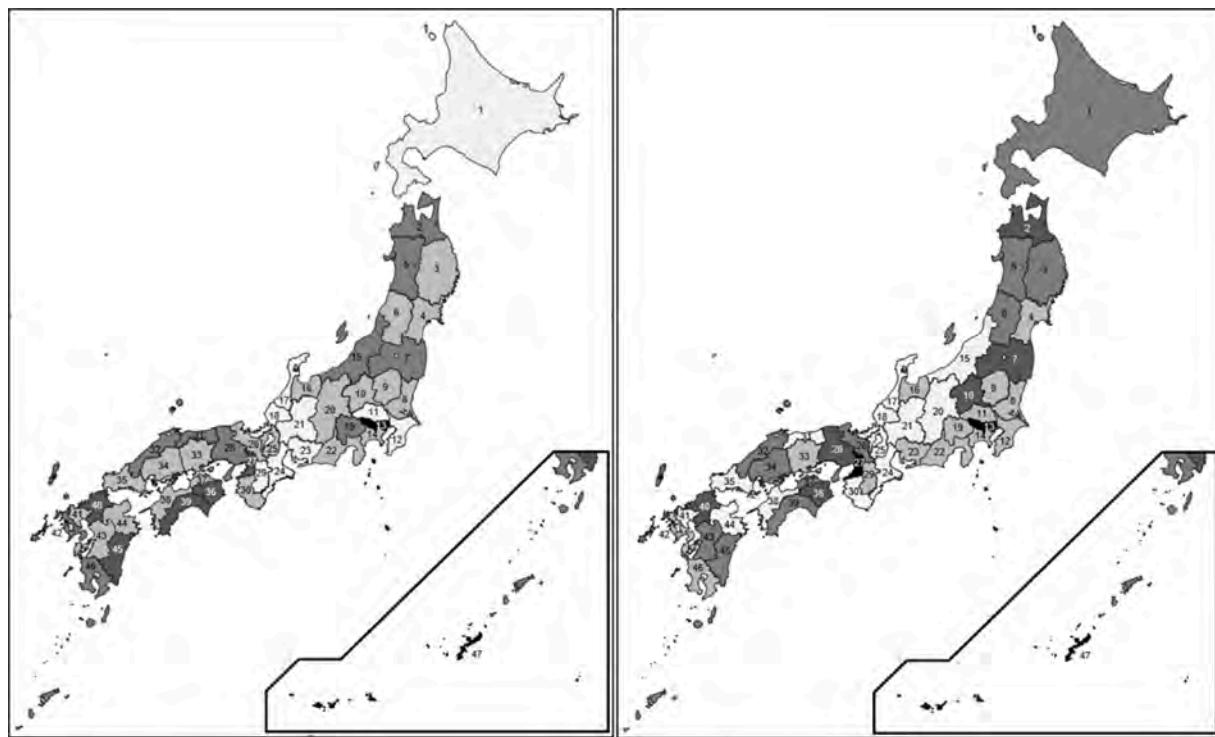

Fig. 3. Age-standardised mortality rates of 100 % alcohol-related deaths for men and women in 2006–2016, in 47 prefectures.

Left is for men and right is for women. The colours for men show age-standardised mortality rate (per 100,000 population); ■(white) <4.0, ■(sky gray) 4.0–4.9, ■(ash gray) 5.0–5.9, ■(gray) 6.0–6.9 ■(black) >7.0. The colours for women show age-standardised mortality rate (per 100,000 population); ■(white) <0.6, ■(sky gray) 0.6, ■(ash gray) 0.7, ■(gray) 0.8–1.0, ■(black) >1.0. The number in the map shows the following prefecture's number; 1. Hokkaido, 2. Aomori, 3. Iwate, 4. Miyagi, 5. Akita, 6. Yamagata, 7. Fukushima, 8. Ibaraki, 9. Tochigi, 10. Gumma, 11. Saitama, 12. Chiba, 13. Tokyo, 14. Kanagawa, 15. Niigata, 16. Toyama, 17. Ishikawa, 18. Fukui, 19. Yamanashi, 20. Nagano, 21. Gifu, 22. Shizuoka, 23. Aichi, 24. Mie, 25. Shiga, 26. Kyoto, 27. Osaka, 28. Hyogo, 29. Nara, 30. Wakayama, 31. Tottori, 32. Shimane, 33. Okayama, 34. Hiroshima, 35. Yamaguchi, 36. Tokushima, 37. Kagawa, 38. Ehime, 39. Kochi, 40. Fukuoka, 41. Saga, 42. Nagasaki, 43. Kumamoto, 44. Oita, 45. Miyazaki, 46. Kagoshima, 47. Okinawa.

4. Discussion

In this study, we analysed the trend of 100 % ARDs in Japan using data from the national death registry. We found that, over the past 22 years, the ASMRs of 100 % ARDs in men levelled off in 2011; however, they gradually increased for women. The average age of women who died from 100 % ARD was five years younger than men. Analysis at the sub-national level showed that prefectural groups with higher alcohol sales per adult had a higher ASMR of 100 % ARDs, and Okinawa, which has a reduced tax rate on liquor, stands out.

4.1. ASMR of 100 % ARD in Japan

In 2016, the ASMR of 100 % ARDs was similar to that of diabetes and traffic accidents in men and higher than that of chronic bronchitis and emphysema in women (Ministry of Internal Affairs and Communications, 2008). In Japan, the recorded APC shown in Fig. 2 peaked in the 1990s and has levelled off, while the total APC, including unrecorded APC, has reportedly increased (World Health Organization, 2015). An increase in alcohol consumption as a whole seems to have influenced the increase in digestive system diseases due to alcohol. According to our results, the increase in 100 % ARDs over the past 22 years was largely attributable to alcohol-related digestive system diseases. In the United States, an increase in alcohol-related mortality rates and alcohol-associated liver disease was reported from 1999 to 2017, especially among middle-aged individuals (White et al., 2020; Moon et al., 2020). Alcohol poisoning has also increased. One factor may be Japanese-style dining bars that offer an all-you-can-drink system called '*Nomihodai*', which motivates young people to increase their alcohol consumption (Kawaida et al., 2018).

4.2. The gender difference in ASMR of 100 % ARD

In Japan, it used to be common that men drank but women rarely drank. However, women have recently developed similar drinking habits, and the decrease in gender differences needs to be observed carefully and the trend needs to be clarified (Osaki et al., 2016). The current results showed that the gender ratio of ASMR of 100 % ARDs is decreasing. In a national population-based survey on drinking conducted every five years since 2003, the number of daily drinkers and risky drinking has decreased in men, but not in women (Osaki et al., 2016). Our finding that 100 % ARDs among women were slowly but consistently increasing reinforces the results from this population-based survey. Additionally, a similar trend was found in the United States (Keyes et al., 2019).

Women have a longer life expectancy than men worldwide; however, our results indicated that women who died by 100 % ARD were approximately five years younger than men (World Health Organization, 2019). Reports of 100 % ARDs in Germany showed the peak age of death was almost identical for men and women, which differed from our findings (Piontek and Kraus, 2018). One of the factors for the younger death age of women might be biological sex differences. Studies show that women are more likely to have alcohol-related problems within a shorter period than men after starting drinking (Erol and Karpyaka, 2015). The other factor would be that women's mean age of drinking is younger than that of men, while the initiation age of drinking is older than men (Osaki et al., 2016). The survey shows that the proportion of the flushing reaction is similar between men and women, and therefore the influence from the flushing reaction might be less (Osaki et al., 2016). Current results show that the sex differences in age of death were detected not only in chronic diseases like mental and behavioural

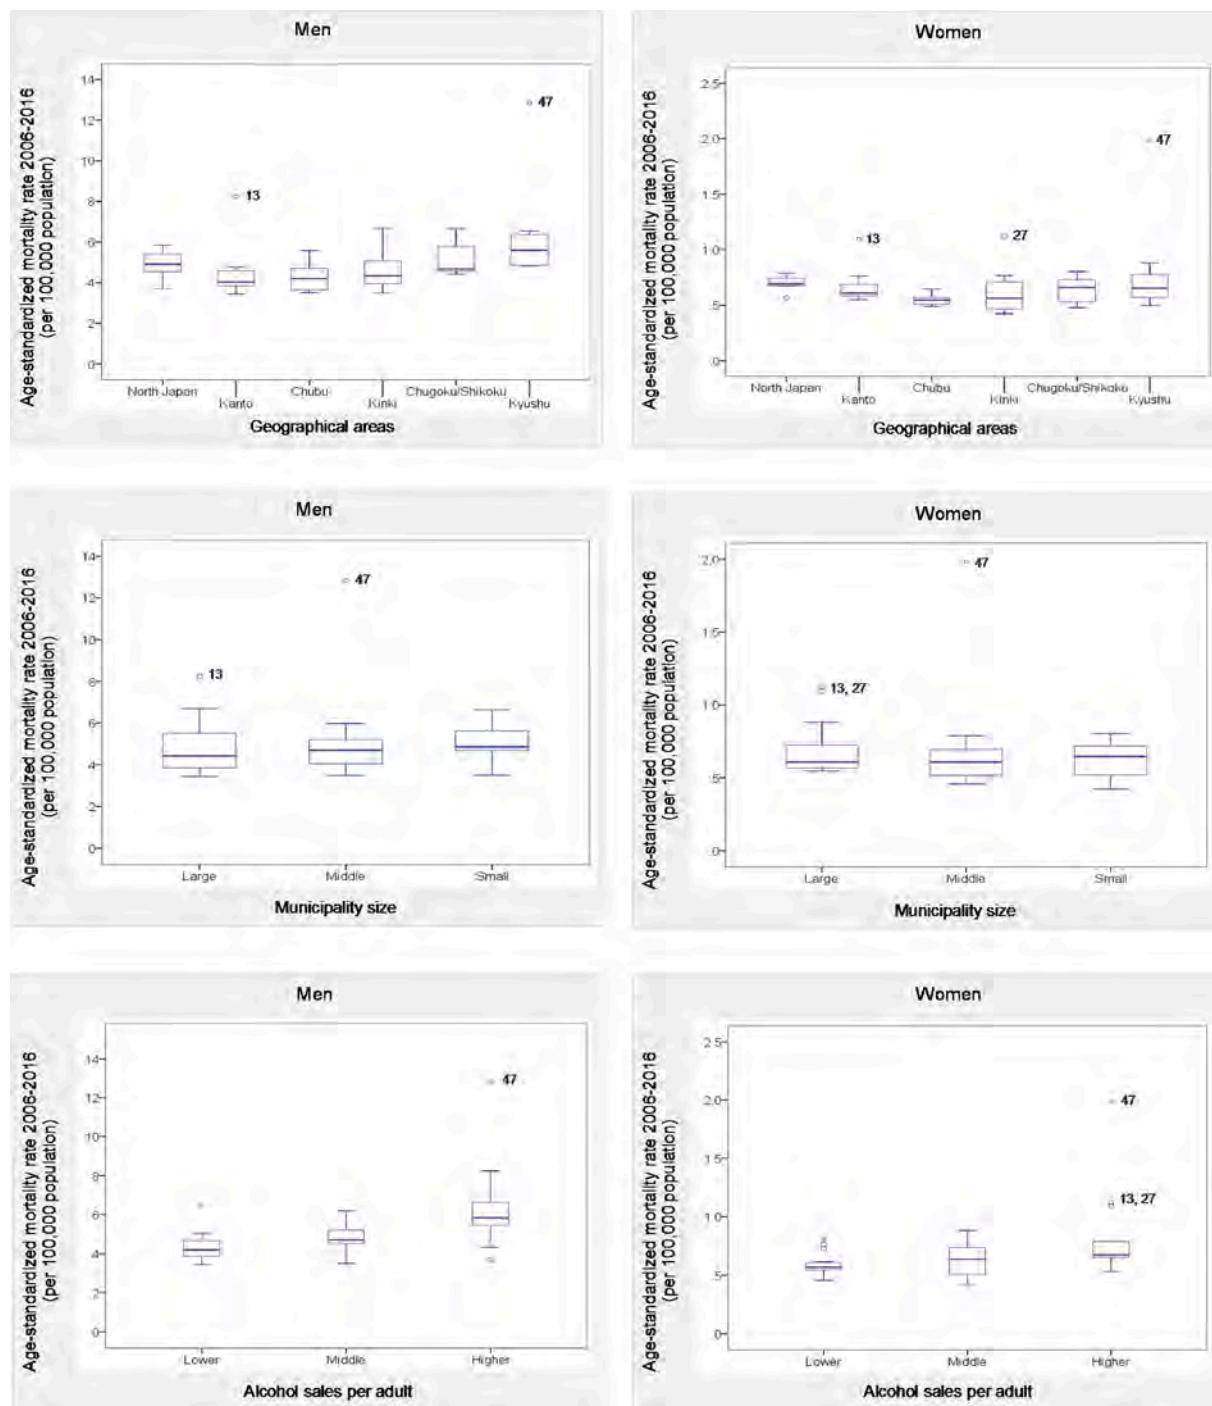

Fig. 4. Comparisons of age-standardised mortality rates for 2006–2016 by geographical area, population size, and annual per capita alcohol consumption. Regarding municipality size, prefectures were divided into three categories: large (more than 2.3 million population during 1995–2015, 15 prefectures), medium (more than 1.26 million population during 1995–2015, 17 prefectures), and small (less than 1.26 million population during 1995–2015, 15 prefectures). Regarding alcohol sales per adult by prefecture, prefectures were divided into three categories: lower (prefecture's annual alcohol sales per adult in 2005 was < 80 L, 12 prefectures), middle (prefecture's annual alcohol sales per adult in 2005 was 80–90 litres, 17 prefectures), and higher (prefecture's annual alcohol sales per adult in 2005 was ≥ 90 L, 17 prefectures). The boxplot shows five number summaries: the smallest observation, first quartile, median, third quartile, and sample maximum by category. The circles (○) show the outliers. The numbers in the chart shows the prefecture number: 13: Tokyo, 27: Osaka, 47: Okinawa.

disorders due to alcohol use and alcoholic liver disease, but also in acute diseases like the toxic effect of alcohol. This result shows that both factors are related to the younger age of death of women. It is necessary to provide accurate information showing that women are more susceptible to negative health outcomes related to drinking.

4.3. Geographical areas, municipality size, alcohol sales per adult and ASMR of 100 % ARD

The ASMR of 100 % ARD differs depending on the prefectures. Therefore, for the purpose of exploring the related factors to higher ASMR, the prefectures were classified by geographical area, by

municipality size, and by alcohol sales per adults, and then the associations between each factor and the ASMR were explored. Geographical distribution could also reflect the traditional culture. One of the reasons why a few areas had higher ASMRs for 100 % ARD in men might be that drinking habits had traditionally been built there. Some prefectures in these geographical areas are thriving with brewing traditional Japanese rice wines called *Sake* or traditional Japanese distilled liquors called *Shochu* (National Tax Agency, 2005; National Research Institute of Brewing, 2018). The population of a prefecture could show to some extent whether the prefecture has a large city. Current results found that there was no association between municipality size and ASMRs for 100 % ARD. Every prefecture has urbanareas and therefore the classification by population would not show the reason for differences in ASMRs by prefecture. However, the ASMRs for 100 % ARD in Tokyo and Osaka were higher than the other prefectures except for Okinawa, and the ASMR would be higher in metropolises.

Alcohol sales per adult had been predicted to have a positive association with ASMRs because it is reported that lower outlet numbers and reduced outlet densities and limited hours and days of sale can effectively reduce alcohol sales and problems in other countries (Gruenewald, 2011). The ASMR for 100 % ARD was highest in the prefectural group with the highest alcohol sales per adult, as expected. Our result suggests that reducing alcohol sales can lead to a reduction in 100 % ARD in Japan. The effectiveness of measures to raise taxes and determine unit prices according to alcohol content has been reported (Wagenaar et al., 2010; Zhao et al., 2013; Sharma et al., 2017; O'Donnell et al., 2019). In 2018, the WHO launched SAFER, 'a new initiative and technical package outlining five high-impact strategies that can help governments to reduce the harmful use of alcohol and related health, social and economic consequences', as a strategy to reduce harmful alcohol use by 10 % by 2025 (World Health Organization, 2018a). In Japan, 'A' (advance and enforce drunk-driving countermeasures) has been legislated, and 'F' (facilitate access to screening, brief interventions, and treatment) is currently being strengthened. However, the current efforts for 'S' (strengthen restrictions on alcohol availability), 'E' (enforce bans or comprehensive restrictions on alcohol advertising, sponsorship, and promotion), and 'R' (raise prices on alcohol through excise taxes and pricing policies) are not enough. In order to lower ASMRs of 100 % ARD, it would probably be effective to work on improving alcohol taxation and pricing policies.

The ASMRs of 100 % ARD in Okinawa for both genders were by far the highest among all 47 prefectures. Nevertheless, a previous study revealed that premature adult mortality rates from 1970 to 2005 were much lower in Okinawa than in other prefectures (Suzuki et al., 2012). The Okinawa Prefecture is the southwestern-most part of Japan, consisting of 57 islands of various sizes. Okinawa is unique within Japan because of its location and the island's culture and history (Institute for International Cooperation Japan International Cooperation Agency, 2000). The direct reason for the highest ASMR of 100 % ARD in Okinawa would be the proportion of current drinkers, heavy drinkers, and binge drinkers (Okinawa prefecture, 2016; Mori and Fukuda, 2020). Okinawa is considered to be the first place where the *Shochu* had been brought from southeast Asia, and each of Okinawa's islands has a unique drinking culture (National Research Institute of Brewing, 2018; nippon.com, 2020). These factors might be related to the highest ASMR of 100 % ARD occurring in Okinawa. Additionally, there is a difference in alcohol policy between Okinawa and the other prefectures. Of Japan's 47 prefectures, only Okinawa has had a reduced tax rate on liquors since 1972 (Cabinet Office, 2017). Okinawa's traditional *Shochu*, Awamori, which has a high alcohol concentration, was designed to have a lower tax rate in order to promote local industry. Compared to Japan's other 46 prefectures, liquor in Okinawa is available at a lower price, suggesting this might be the other factor for the high ASMR of 100 % ARD. One effective way to reduce Okinawa's ASMR of 100 % ARD would be to revise the reduced tax rates.

4.4. Limitations

One limitation of this study is that it did not include data on less than 100 % ARDs, such as cancer. According to a previous report on alcohol-related cancer deaths in 2005, there are about five times more alcohol-contributed cancer deaths (approximately 20,000) than 100 % ARDs (Inoue et al., 2012). However, only the detailed drinking rates in Japan after the year 2003 can be obtained (Osaki et al., 2016; Zaitsu et al., 2020; National Institute of Health and Nutrition, 2013). Additionally, the survey for detailed drinking rates was conducted every five years. It is necessary to conduct the survey more frequently for the yearly changes of all ARD to be monitored.

Second, there is a limitation regarding the accuracy of causes of death in the national death registry system. The national death registry system is based on a death or autopsy certificate made by a physician at the time of death. Thus, cause of death is listed at the doctor's discretion. In medical education, students perform exercises to determine cause of death as described on death certificates, guaranteeing quality to some extent. However, when a possible cause of death other than alcohol also exists, a cause other than a 100 % ARD may be provided. For example, in an analysis of individuals who drowned in the bathtub, blood ethanol was detected in 146 out of 357 people. Of those, acute ethanol intoxication was recorded on the death certificate of seven individuals, while the cause of death listed for most of them was drowning (Suzuki et al., 2015). Thus, 100 % ARDs are likely to be underestimated.

In conclusion, the current study suggested that in Japan, ASMR of 100 % ARD among men stayed high and increased among women. According to prefecture-level analysis, per capita alcohol sales were positively associated with ASMRs of 100 % ARD. Strengthening alcohol-control policy is necessary to reduce ARDs in Japan. In particular, the prefecture with the highest mortality rates should reconsider its reduced alcohol tax system.

Role of Funding Source

This work was supported by 'Japan Agency for Medical Research and Development' Research and Development Grants for Comprehensive Research for Persons with Disabilities [2016 to 2018 Research on measures for controlling addiction, grant number-18dk0307056h0003].

Contributors

All authors have materially participated in the research or article preparation. SH planned the survey and received the funding. AK and YO designed the survey. AK, BP, and TO contributed in analyzing and interpreting the data and writing the report. YK, MF, and YO contributed in analyzing and interpreting the data.

All authors approved the final manuscript before submission.

Declaration of Competing Interest

The authors report no declarations of interest.

Gender difference

ABSTRACT

Unhealthy dietary behaviors in adolescence are an important public health problem. Gender differences in dietary behaviors have already appeared during adolescence. However, few studies have assessed a variety of adolescent dietary behaviors in Japan. We aimed to clarify gender differences in unhealthy dietary behaviors among Japanese adolescents. The participants consisted of 84,988 participants from seventh to 12th grades. Unhealthy dietary behaviors were defined according to the National Health and Nutrition Survey. Multivariable logistic regression was used to analyze a nationally representative sample of Japanese adolescents from the 2014 to 2015 Lifestyle Survey. The effective response rate was 51.4%. The prevalence of unhealthy dietary behaviors (skipping breakfast, snacking, eating out, skipping meals, eating alone at dinner, and subjectively poor diet quality) among boys and girls was 14.2% versus 12.4%, 19.6% versus 14.1%, 10.6% versus 7.0%, 7.9% versus 5.6%, 13.3% versus 12.1%, and 12.3% versus 15.8%, respectively. Compared with boys, girls were more negatively associated with skipping breakfast [OR = 0.76 (95% CI 0.73–0.79)], snacking [OR = 0.67 (95% CI 0.65–0.70)], eating out [OR = 0.62 (95% CI 0.59–0.66)], skipping meals [OR = 0.61 (95% CI 0.58–0.65)], and eating alone at dinner [OR = 0.79 (95% CI 0.76–0.83)]. However, girls were more positively associated with subjectively poor diet quality [OR = 1.19 (95% CI 1.14–1.24)]. The findings suggest that gender differences existed in dietary behaviors. Gender differences in dietary behaviors suggest opportunities for tailoring interventions related to dietary education in schools.

1. Introduction

Adolescence is an important period for physical and psychological development. Dietary behaviors once established in adolescence tend to continue throughout life (Wahl, 1999). Unhealthy dietary behaviors during adolescence can result in nutritional deficiency and delayed growth and may also have a negative effect on performance in school (Kim et al., 2016). Adolescent unhealthy dietary behaviors are associated with other health-related behaviors (Neumark-Sztainer et al., 1997). For example, skipping breakfast has been linked to insomnia (Kaneita et al., 2006). Frequent snacking is a risk factor for poor dietary behaviors, and is related to lifestyle behaviors (Larson et al., 2016). In Korean high school students, distress not only increased instant food and snack intake, but also the frequency of eating out (Hong and Kim, 2014). Skipping meals is an unhealthy method to promote weight loss and a potential risk factor for eating disorders (Neumark-Sztainer et al.,

2012). Shared meals may protect against nutritional-related health problems, including obesity, other unhealthy dietary behaviors, and eating disorders (Fulkerson et al., 2014). A cross-sectional study targeting Australian adolescents showed that poor diet quality was associated with depression (Jacka et al., 2010). Furthermore, unhealthy dietary behaviors increase the risk of obesity and non-communicable diseases (Amine et al., 2002; Story et al., 2000). Therefore, unhealthy dietary behaviors in adolescence have been suggested as an important public health issue (Moreno et al., 2014). It is necessary to develop strategies to promote healthier dietary behaviors.

Gender differences in dietary behaviors have already appeared during adolescence (Reynolds et al., 1999). For example, adolescent boys eat faster than adolescent girls in Korea (Jeong et al., 2014). Furthermore, compared with boys, girls tend to give consideration to their food choices (Rolls et al., 1991). The incidence of obesity continues to increase worldwide among children and is particularly high in

E-mail address: nusmpublichealth@gmail.com (Y. Kaneita).

developed countries (Ng et al., 2014). In Japan, while obesity is increasing among boys, leanness is increasing among girls (Ministry of Education, Culture, Sports, Science and Technology, 2018). Adolescent girls' leanness may lead to future osteoporosis (Rigotti et al., 1991) and delivery of a low-birthweight infant (Ronnenberg et al., 2003). Compared with other countries, Japan shows a specific trend. Thus, it is important to study dietary behaviors in adolescence by gender.

However, few studies have comprehensively assessed adolescent dietary behaviors by gender in Japan. Furthermore, most previous studies were conducted in the U.S. and other Western countries. To address these issues, we conducted a large-scale survey of adolescents' lifestyles throughout Japan. Based on previous reports (Reynolds et al., 1999; Rolls et al., 1991), we hypothesized that boys tend to adopt unhealthy dietary behaviors to a greater extent than girls. In this study, we aimed to investigate gender differences in unhealthy dietary behaviors among Japanese adolescents.

2. Methods

2.1. Participants

Of the 10,547 junior and 4807 senior high schools registered in Japan in May 2013, 140 junior (selection rate: 1.3%) and 124 senior (selection rate: 2.6%) high schools were sampled. We used a stratified, single-stage cluster-sampling method to divide Japan into regional blocks and randomly selected schools from each block. To avoid any sampling bias, stratified sampling was performed with regional blocks as the strata. All the students in the sampled schools were the study participants. The sample size was determined by the response rate and confidence intervals based on the variance of the results obtained from a previous study (Osaki and Minowa, 1996).

In the Japanese education system, children enter elementary school at the age of 6 years and leave after 6 years of study. They then enter junior high school for 3 years of study, followed by a further 3 years in senior high school. Education is mandatory in junior high school. In this study, the first to third years of junior high school are called the 7th to 9th grades, and the first to third years of senior high school is called the 10th to 12th grades.

2.2. Survey procedure

We sent a letter to the principal of each selected school for cooperation in the survey, along with the same number of questionnaires and envelopes as the number of students enrolled at the school. Schools, where the principals had agreed to the survey and had received questionnaires and envelopes, also required each class teacher to inform the students and ensure the protection of the privacy of the respondents. Teachers explained to the students about confidentiality and voluntary participation, and delivered the completed questionnaires in the sealed envelopes back to our department. The survey was conducted from October 2014 to January 2015. This study was approved by the research members' institutional Ethical committee.

2.3. Measures

The major sections of the questionnaire were (1) personal data, (2) dietary behaviors, (3) lifestyle, and (4) mental health status. Personal data included gender, school grade, and type of school.

2.3.1. Dietary behaviors

To ensure reliability of the dietary behaviors, we used the questions of the 2007 National Health and Nutrition Survey (NHNS) established by the Ministry of Health, Labor and Welfare (Ikeda et al., 2015). The unhealthy dietary behaviors in the present study were based on definitions used in previous studies (Otsuka et al., 2019; Videon and Manning, 2003; Wijtzes et al., 2015):

1) Skipping breakfast

How often did you eat breakfast during the previous month? (1. Almost every day, 2. Sometimes, 3. Seldom). Skipping breakfast was defined when answered as "Sometimes" or "Seldom."

2) Snacking

How many times per day did you snack during the previous month? (1. Over 14 times/week, 2. 7–13 times/week, 3. 2–6 times/week, 4. under once/week, 5. None). Snacking was defined when answered as "Over 14 times/week."

3) Eating out

How many times per day did you eat out during the previous month? (1. Over 14 times/week, 2. 7–13 times/week, 3. 2–6 times/week, 4. under once/week, 5. None). Eating out was defined when answered as "Over 14 times/week" or "7–13 times/week."

4) Skipping meals

How many times per day did you skip a meal during the previous month? (1. Over 7 times/week, 2. 4–6 times/week, 3. 2–3 times/week, 4. under once/week, 5. None). Skipping meals was defined when answered as "Over 7 times/week" or "4–6 times/week."

5) Eating alone at dinner

When you ate dinner at home during the previous month, who did you eat with? (1. All the family, 2. Some of the family, 3. Alone, 4. Other). Lack of family dinner was defined when answered as "Alone."

6) Subjectively poor diet quality

How was the quality of meals at home during the previous month? (1. Very good, 2. Good, 3. Bad, 4. Very bad). Subjectively poor diet quality was defined when answered as "Bad" or "Very bad."

2.3.2. Covariates

To determine the following covariates, we referred to factors associated with dietary behaviors in previous studies (Fulkerson et al., 2014; Jacka et al., 2010; Kaneita et al., 2006; Kim et al., 2010; Larson et al., 2016; Neumark-Sztainer et al., 1997). The lifestyle questionnaire assessed current smoking, current alcohol drinking, participation in club activities, exercise habits, more than 5 h of internet usage on weekdays, insomnia symptoms, and interest in being healthy. The covariate of internet usage time was derived from a previous study in which Japanese adolescents using ≥ 5 h of internet on weekdays were categorized as "high-risk" group for problematic internet use (Mihara et al., 2016). Internet addiction in adolescents can negatively affect dietary behaviors (Kim et al., 2010). Insomnia is defined when there is presence of one or more of the following symptoms: difficulty in initiating sleep, difficulty in maintaining sleep, and early morning awakening (Kaneita et al., 2006). Mental health status was assessed using selected items from the 12-item General Health Questionnaire (GHQ-12) (Doi et al., 2003; Goldberg et al., 1976). In this study, we used the assessments for "depression and anxiety" and "decrease in positive feeling" from the GHQ-12. One question from each of the two factors was selected for this study. Students who answered affirmatively to either question were classified as having poor mental health (Suzuki et al., 2011).

2.4. Data analysis

First, we calculated the demographic characteristics of the analyzed participants and the 95% confidence intervals. Next, we calculated the prevalence and the 95% confidence interval of each unhealthy dietary behavior by gender and school grade and compared gender differences using the chi-squared test. Finally, to examine the gender differences in unhealthy dietary behaviors, multiple logistic regression analyses were performed. School grade, drinking alcohol, smoking, extracurricular activities, interest in being healthy, exercise habits, insomnia, mental health status, and 5-or-more hours of internet use on weekdays were used as the covariates. We set the level of significance at $P < 0.01$. All analyses were performed using SPSS version 17.0.

Table 1
Demographic characteristics of analyzed participants (%).

	Boys N = 41,225	%	95%CI	Girls N = 43,763	%	95%CI
Grade

3. Results

This study enrolled 165,269 students who randomly selected junior and senior high schools. The total number of respondents was 85,931. Overall, 943 questionnaires were excluded because gender was not specified or the responses were inconsistent. Data from the remaining 84,988 questionnaires were analyzed. The effective response rate was 51.4%.

Table 1 shows the demographic characteristics of the participants by gender. The proportion of boys was higher in grades 7–9 and that of girls was higher in grades 10–12. Regarding drinking alcohol, smoking, club activities, and exercise habits, the proportion of boys was significantly higher than that of girls. Regarding poor mental health, interested in being healthy, and heavy Internet users during the weekday, the proportion of girls was significantly higher than that of boys.

Fig. 1 shows the prevalence of unhealthy dietary behaviors by gender and school grade. The prevalence of skipping breakfast was significantly lower among girls than among boys (12.7%: 95%CI 12.4–13.0 vs. 14.9%: 95%CI 14.6–15.2, $\chi^2 = 83.65$, $p < .001$). The tendency to skip breakfast increased among boys and girls with higher grades (Fig. 1A). The prevalence of snacking among girls was significantly lower than that among boys (14.6%: 95%CI 14.3–15.0 vs.

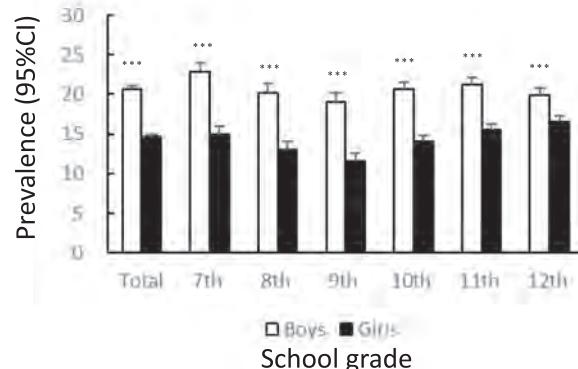

Fig. 1. (continued)

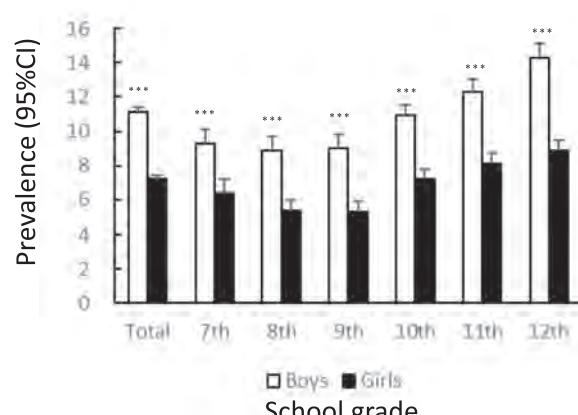

Fig. 1. (continued)

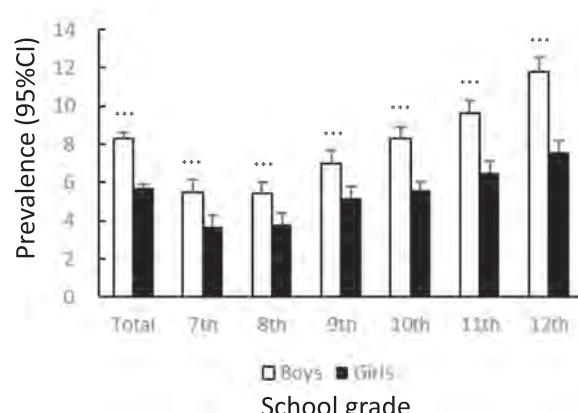

Fig. 1. (continued)

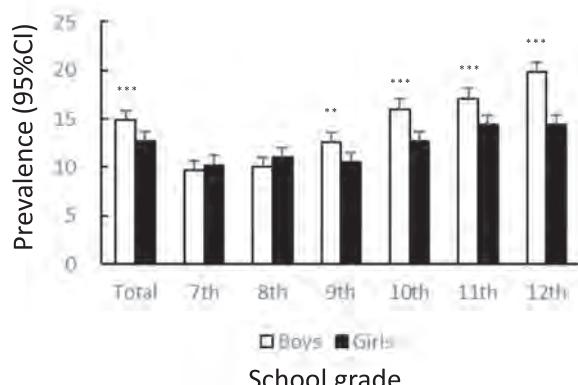

Fig. 1. Prevalence of unhealthy dietary behaviors among Japanese adolescents by gender and school grade.

20.6%: 95%CI 20.2–21.0, $\chi^2 = 521.4$, $p < .001$). In both boys and girls, this percentage declined after the 7th grade, bottomed out in the 9th grade, and then rose again (Fig. 1B). The prevalence of eating out was significantly lower among girls than among boys (7.2%: 95%CI 6.9–7.4 vs. 11.1%: 95%CI 10.8–11.4, $\chi^2 = 372.8$, $p < .001$). In boys and girls, the higher the grade, from 10th to 12th, the higher the prevalence of eating out (Fig. 1C). The prevalence of skipping meals was significantly lower among girls than among boys (5.7%: 95%CI 5.5–6.0 vs. 8.3%: 95%CI 8.0–8.6, $\chi^2 = 205.0$, $p < .001$). In boys and girls, the higher the grade in schools, the higher the prevalence of skipping meals (Fig. 1D). The prevalence of eating alone at dinner was significantly lower among girls than among boys (13.9%: 95%CI 13.6–14.3 vs. 16.0%: 95%CI 15.7–16.3, $\chi^2 = 73.96$, $p < .001$). The prevalence

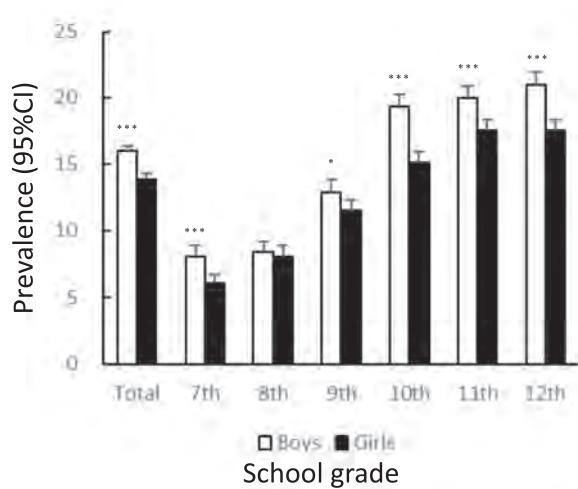

Fig. 1. (continued)

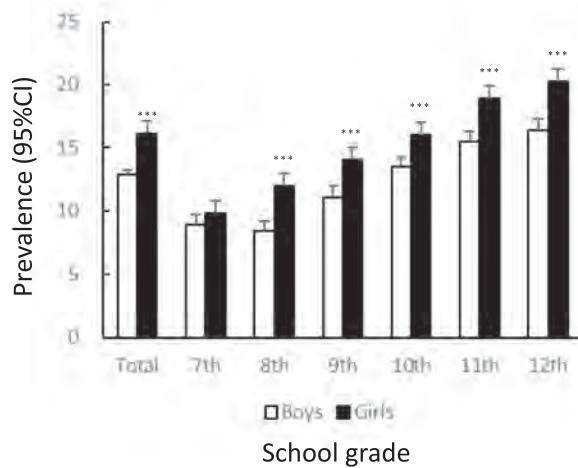

Fig. 1. (continued)

tended to increase with higher grades in both boys and girls (Fig. 1E). The prevalence of subjectively poor diet quality was significantly higher among girls than among boys (16.1%: 95%CI 15.7–16.5 vs. 12.9%: 95%CI 12.6–13.2, $\chi^2 = 175.1$, $p < .001$). The prevalence tended to increase with higher grades in both boys and girls.

Table 2 shows the logistic regression results for the gender

differences in unhealthy dietary behaviors among Japanese adolescents. After adjusting for covariates, girls compared to boys were more negatively associated with skipping breakfast [AOR = 0.76 (95% CI 0.73–0.79)], snacking [AOR = 0.67 (95% CI 0.65–0.70)], eating out [AOR = 0.62 (95% CI 0.59–0.66)], skipping meals [AOR = 0.61 (95% CI 0.58–0.65)], and eating alone at dinner [AOR = 0.79 (95% CI 0.76–0.83)]. On the contrary, girls were more positively associated with subjectively poor diet quality [AOR = 1.19 (95% CI 1.14–1.24)].

4. Discussion

This is the first study to examine gender differences in unhealthy dietary behaviors among Japanese adolescents. The results suggest that gender differences in dietary behaviors appear to be partly related to their beliefs regarding healthy eating. This study had two strengths: 1) a nationwide survey and 2) an extremely large sample. Many studies have examined a few unhealthy dietary behaviors, such as skipping breakfast. However, we found almost no similar studies examining the prevalence of a variety of dietary behaviors. Furthermore, few studies have been conducted on adolescents' dietary behaviors in Asia. Therefore, this study makes an important contribution to health education.

Overall, the present study indicated that girls tended to adopt regular dietary behaviors as compared to boys, but they seemed dissatisfied with the quality of their diet. This is partially consistent with previous studies (Reynolds et al., 1999; Rolls et al., 1991). Reasons for different dietary behaviors can be found in nutrition knowledge and attitude. Girls have more nutrition knowledge than boys and are extremely self-conscious about their bodies (Pirouznia, 2001; Rampersaud et al., 2005). In contrast, girls showed lower intake of essential vitamins and minerals and lesser ingestion fruits and vegetables as compared to boys (Johnson et al., 1994). Boys tended to have meals that were higher in total fat and saturated fat as compared to girls (Muñoz et al., 1997). Thus, boys and girls showed a significant difference in their dietary behaviors. In future studies, it is necessary to identify these differences.

Previous studies on skipping breakfast and meals have shown inconsistent gender differences (Oba et al., 2016; Smetanina et al., 2015; Smith et al., 2017; Vereecken et al., 2009). In Western countries, girls skip breakfast and other meals more frequently than boys (Smith et al., 2017; Vereecken et al., 2009). However, similar to the present study, another cross-sectional study among Japanese adolescents reported that there is a significant association between skipping meals and male gender (Oba et al. 2016). Although the reason for this gender difference is not known, more boys reported frequent snacking and eating out as compared to girls, and the gender distribution could explain it. Despite the low frequency of skipping meals among adolescent girls, the prevalence of lean women in their 20 s is very high (21.7%) as compared to

Table 2

Logistic regression results for the gender differences about unhealthy dietary behaviors among Japanese adolescents.

Unhealthy dietary behaviors	Girls compared with boys					
	Crude OR	95%CI	p-value	Adjusted OR	95%CI	p-value
Skipping breakfast	0.83	0.80–0.86	< 0.001	0.76	0.73–0.79	< 0.001
Snacking	0.66	0.63–0.68	< 0.001	0.67	0.65–0.70	< 0.001
Eating out	0.62	0.59–0.65	< 0.001	0.62	0.59–0.66	< 0.001
Skipping meals	0.67	0.64–0.71	< 0.001	0.61	0.58–0.65	< 0.001
Eating alone at dinner	0.85	0.81–0.88	< 0.001	0.79	0.76–0.83	< 0.001
Subjectively poor diet quality	1.30	1.25–1.35	< 0.001	1.19	1.14–1.24	< 0.001

Participants with missing data were excluded from the analysis.

Adjusted for grade, club activity, exercising habit, mental health, long time internet user, alcohol drinking, smoking, and interest in being healthy at multiple logistic regression.

P value was calculated using the multiple logistic regression analysis.

"Skipping Breakfast" was calculated as the sum of "Seldom and Sometimes". "Snacking" was defined as "Over 14 times/week". Eating out was defined as "Over 14 times/week and 7–13 times/week". Skipping meals was defined as the sum of percentage "Over 7 times/week and 4–6 times/week". Eating dinner at alone was defined as "Alone". Subjectively poor diet quality was defined as the sum of "Very bad and Bad".

AOR: adjusted odds ratio; CI: confidence interval;

lean men (9.1%) (Ministry of Health, Labour and Welfare, 2017). Thus, it is suggested that Japanese young girls are more worried about their weight than the boys are. Girls are known to present more body image distortion as compared to boys (Smolak, 2004). Moreover, girls are more likely to sense themselves as overweight when in fact they are average or even underweight, while many boys are likely to be concerned about being overweight when they are actually obese. Skipping meals is often used as a weight-loss method (Neumark-Sztainer et al., 2012). The present study showed that Japanese girls might not skip meals, but instead reduce the amount of food and worsen the quality of their food, for e.g., cut down intake of carbohydrates. In future studies, the question of how they feel about their own weight and the nutrition or energy from meals should be addressed.

We found significant differences in the prevalence of snacking by gender. Adolescent boys snacked more often perhaps because adolescent boys have voracious appetites, which might result in hunger and the need to eat during break times while undergoing club activities. Interestingly, the gap between boys and girls with respect to snacking diminished as the grade increased. A cross-sectional study in Poland youth reported that women snack more frequently on sweets, biscuits, nuts, and seeds, whereas men tend to snack on salty snacks, add sugar to beverages, and add salt to dishes (Zaborowicz et al., 2016). Participants with insufficient nutritional knowledge snack more frequently on salty snacks rather than fruit (Zaborowicz et al., 2016). Thus, age and gender may affect snacking behaviors. Snacking is generally considered a factor in the development of overweight and obesity in childhood (Nicklas et al., 2003). These results suggest the necessity of a multi-dimensional survey with respect to adolescents' age and gender for healthy snacking behavior.

Regarding the frequency of family dinners, consistent with previous studies, we found that boys ate alone at dinner less often than girls (Goldfield et al., 2011; Shirasawa et al., 2018). One explanation for this is that boys often eat fast food after school and club activities; thus, they have fewer opportunities for family dinners. Previous studies have reported that family meal times may act as a protective factor against nutritional health-related problems encountered during adolescence, including unhealthy dietary behaviors (Hammons and Fiese, 2011). Another explanation is that the schedule of the cram school may affect family dinners. Because of adolescents' cram school sessions and their parents' jobs, the number of times a Japanese family eats a meal together has reduced (Kojima, 2011). Therefore, our findings suggest that health educators need to promote the importance of family dinners and the risks related to eating alone.

In contrast to the above results, we found that the prevalence of subjectively poor diet quality was higher among girls. Studies have reported that girls tend to hold stronger diet-related beliefs than boys (Davy et al., 2006; Wardle et al., 2004). Thus, girls may underestimate the quality of their diet, while boys may overestimate them. Although girls regularly eat meals, the result also suggests that girls may be restricted to the amount of meals. Future research is needed to use objective indicators such as the Diet Quality Index (Vyncke et al., 2013).

The results of the current study also suggested that some dietary behaviors such as skipping breakfast, eating out, eating alone, subjective poor diet quality were likely to have an interaction between gender and school grade which meant age. The findings in the current study support in line with the several previous studies which show that pubertal status may affect on skipping meals and snacks (Lee and Lee, 2013; Nu et al., 1996). Another explanation for that is that high school students (grade 10–12) tend to eat in accordance with their own daily rhythms, thus dietary behaviors are easily disturbed. Therefore, our findings suggest that health educators need to change the content of education in dietary behaviors depending on the grade.

This study had several limitations. First because it was a cross-sectional study, the cause and effect relationships for each dietary behavior, or how these may have changed over time, could not be determined. For example, poor mental health status could affect dietary

and other behaviors more when compared to healthy mental status (Brausch and Gutierrez, 2009). In the present study, we could use only two items from GHQ-12 for mental health due to limited space in the questionnaire. To focus more on the adolescents' mental health status in future surveys, all GHQ items may need to be included for accurate measurement. Second, data for the study were collected via a self-administered questionnaire. Using a validated method to assess meal balance over the previous 24 h, for example, would have provided strong evidence that could have been used in the study. Third, no data were obtained on participants' weights or socio-economic factors, such as family income or the educational levels of the participants' parents. Future research should include socio-economic factors and their actual and ideal weights. Fourth, about 40% of non-responses existed, because minors aged < 20 years in Japan are prohibited by law from smoking and drinking alcohol. Therefore, schools and students tend to be non-cooperative in responding to questions on their smoking and drinking status. However, the present survey response rate had some acceptability (Johnson and Wislar, 2012).

5. Conclusion

The current study found that dietary behaviors differed between genders, and these differences varied among junior and senior high school. Future research should examine factors in the home environment, such as socioeconomic status (SES) and use of electronic devices during meals. Our results highlight the importance of developing gender-specific prevention strategies. Integrating strategies in health education in schools could contribute to improving adolescent health. Interventions should focus on healthy eating behaviors and improving food quality. It would be advisable to focus on developing healthy eating habits in boys, and education in girls regarding the necessary nutrients and proper energy intake. Schools need to not only teach the importance of proper dietary behaviors, but also support modeling and reinforcing healthy dietary behaviors. Adolescents have easy access to high fat and high sugar food and beverage products around school. Hence, schools need to create a supportive and integrated nutrition environment.

Abstract

Subjective happiness is often regarded as a major life goal. Although Japan is an economically powerful country, the level of subjective well-being reported among Japanese adolescents is lower than in other countries. We aimed to investigate the lifestyle factors related to unhappiness in Japanese adolescents. We collected data through the 2017–2018 Lifestyle Survey of Adolescents, a nationally representative cross-sectional study enrolled in randomly selected junior and senior high schools throughout Japan. We assessed the prevalence of subjective unhappiness in junior and senior high school students according to school life factors and daily lifestyle habits. A multivariable logistic regression analysis was used to examine the associations between these factors and unhappiness. A total of 64,329 students were included in the sample (mean age 15.7 years, 53.9% boys). The average prevalence of unhappiness was 10.2%. The logistic regression analyses indicated that unhappiness was strongly associated with being male and with engaging in unhealthy lifestyle behaviors such as not having breakfast, poor sleep quality, and some problematic Internet usage. Although the prevalence of unhappiness was significantly higher among current smokers and alcohol drinkers, these behaviors were not associated with unhappiness in the multivariable logistic regression analysis. Unhappiness among Japanese adolescents appears to be strongly related to how they spend their daily life. We therefore consider it desirable for school officials to educate students on the importance of happiness and lifestyle factors conducive to happiness.

Introduction

Subjective happiness has received increasing attention from academics and policymakers around the world as a global measure of subjective well-being [1, 2]. In the psychometric

循環器等-一般-008 from the Ministry of Health Labor and Welfare of the Japanese Government to Y. Osaki. The funder had no role in study design, data collection and analysis, decision to publish, or preparation of the manuscript.

Competing interests: The authors have declared that no competing interests exist.

literature, subjective well-being consists of evaluative and affective elements [3]; evaluative well-being reflects individuals' judgments about the quality and virtue of their lives [4], while affective well-being reflects positive emotions and moods such as happiness, joy, excitement, and cheerfulness, as well as avoidance of pain and depression [5]. Although there are many examples of people who have achieved meaning and fulfillment in life without enjoyment, the different types of subjective well-being are on average positively correlated [6]. Thus, many regard subjective happiness as a major life goal [1] with numerous positive effects on physical and mental health, including improved cardiovascular function [7], improved sleep quality [8], an increased survival rate [9], and increased quality of life [10].

However, the above findings pertain to adults only; few studies have targeted adolescents. Adolescence is a period of rapid physical and psychological change intrinsically linked to adulthood [8]—indeed, happiness in adolescence is associated with happiness in adulthood. Furthermore, happiness in childhood is related to social and coping skills (which predict subjective happiness) in adulthood [11]. Happiness in adolescence is also associated with lifestyle behaviors such as physical activity, eating habits, smoking, and alcohol use [12–14]. For instance, a cross-sectional survey in Hong Kong targeted 45,857 secondary school students and found that students who reported fewer than two days of exercise per week were up to 32% more likely to be unhappy than those who reported three to seven days of exercise. Further, the risk of unhappiness increased with the number of days of drinking, and current and former smokers were more likely to be unhappy than those who never smoked [13]. Subjective happiness is also negatively related to problematic Internet usage [15–17]. A cross-sectional study of 56,086 adolescents in Taiwan showed that adolescents who reported being unhappy had a higher risk of Internet addiction—1.54 times higher in boys and 1.88 times higher in girls—than adolescents who were happy [16]. A study in Chile targeting 3461 students 17 to 24 years old reported that eating lunch, fruits, and vegetables every day increased the likelihood of being classified as "very happy" [14]. Thus, happy adolescents are less likely to engage in a variety of harmful and unhealthy behaviors, including smoking, drinking, unhealthy eating, and problematic Internet usage. Increasing adolescents' subjective happiness might improve their social adaptability and quality of life later on [18, 19]. Therefore, the positive impacts of subjective happiness can benefit health through indirect relationships with health promotion activities.

A study targeting 540,000 fifteen-year old students found that the happiness levels of Japanese students was ranked 42 out of 47 countries and regions (including Organisation for Economic Co-operation and Development [OECD] countries and partner nations) [20]. As such, it is important to implement strategies aimed at improving Japanese youths' overall happiness, which requires consideration of the factors related to happiness, such as gender [14] and environmental factors, including school support structures, communication between parents and children, and academic load [21]. Teachers and policymakers would find it challenging to improve parent-child relationships as a method of increasing adolescents' happiness. Though change is not an immediate process, addressing lifestyle behaviors and the school environment while attempting to address parent-child relationship quality might result in more immediate benefits than solely focusing on a single factor.

No studies have actually investigated the associations between lifestyle factors and unhappiness in Japanese adolescents. In 2000, the Government of Japan formulated a comprehensive health policy, Health Japan21, and set daily lifestyle goals such as increasing breakfast intake and reducing drinking and smoking in minors [22]. Internet addiction has also become a serious public health issue, and its effects are particularly detrimental to young people, who are in the process of growing both mentally and socially [23]. Targeting lifestyle factors allows us to orient adolescents toward future happiness by improving the conditions of not-yet-happy

adolescents. Although there have been previous reports on “unhappiness at school” in a nationwide survey [24], we were interested in the “feeling that school is not fun” (based on the Japanese wording of the questionnaires) rather than unhappiness. In actuality, numerous extracurricular activities and aspects of adolescent lifestyle occur outside of school; therefore, increasing the range of variables is needed, including not only school life, but also daily life behaviors to accurately evaluate unhappiness in adolescents. Identifying the factors associated with subjective unhappiness among adolescents is a step toward addressing unhappiness in adolescents and thereby improving individuals’ future physical and mental health. Therefore, we conducted a large-scale survey on how different lifestyle factors among adolescents throughout Japan are associated with unhappiness. Based on previous research, we hypothesized that adolescents’ levels of unhappiness would be associated with daily behaviors, such as Internet usage; whether they participate in school extracurricular activities, sleep quality, eating behavior; and gender. Daily activities facilitate group intervention education in schools, and considering which behaviors are associated with adolescents can inform future surveys and policies on lifestyle interventions to improve happiness.

Materials and methods

Participants

We collected data via the 2017–2018 Lifestyle Survey of Adolescents. Of the 10,235 junior and 4,907 senior high schools registered in Japan in May 2017, we sampled 98 junior (selection rate: 0.96%) and 86 senior (selection rate: 1.75%) high schools using a stratified, single-stage cluster-sampling method, which involved dividing Japan into regional blocks and randomly selecting schools from each block. We used this method to limit sampling bias. All students in the sampled schools were included. The sample size was determined using the response rates and confidence intervals based on variance of results obtained from a previous study [25]. Replies were obtained from 48 junior high schools (school response rate: 49.0%) and 55 senior high schools (school response rate: 64.0%; total school response rate: 56.0%) and enrolled 118,303 students in the study. A total of 64,417 individuals responded. We excluded 88 questionnaires lacking gender information or with inconsistent responses. Consequently, 64,329 questionnaires were analyzed (effective response rate = 54.4%). The age range was 12–19 years (mean = 15.7 ± 1.7 years).

Survey procedure

We sent a letter to the principals of selected schools requesting their cooperation, along with questionnaire forms and envelopes for enrolled students. In participating schools, we had class teachers inform students of the study, including its confidentiality and voluntary participation, and assure them that their privacy would be protected. There was an option to withdraw from the study or refuse to complete the questionnaire. Teachers delivered the completed questionnaires in the sealed envelopes back to our office. The survey was administered between December 2017 and February 2018.

Measures

The questionnaire assessed (1) personal data, (2) lifestyle behaviors, (3) school life, and (4) subjective happiness. Personal data included school type (junior high school or senior high school), gender, age, and school grade.

For lifestyle behaviors, we assessed frequency of having breakfast (“every day,” “sometimes,” or “seldom”), drinking and smoking status, subjective sleep quality (“very good,”

“good,” “bad,” or “very bad), and Internet usage. As for eating breakfast, respondents who selected “every day” were included in the “yes” category and those who selected “sometimes” or “never” were collapsed into the “no” category for analysis [26]. Participants were defined current smokers if they answered that they had smoked one cigarette per day or more in the past month. Similarly, we defined those who responded that they had drunk alcohol one day or more in the past month as being current drinkers [26]. For subjective sleep quality, participants who responded with “bad” or “very bad” were considered to have poor subjective sleep quality [26]. To assess Internet usage, we used the 8-item version of the Young Diagnostic Questionnaire for Internet Addiction (YDQ) [27]. Each item is rated dichotomously (“yes” or “no”).

As for school life, participation in extracurricular activities (“active participation,” “passive participation,” or “no participation”) and future direction were asked. To evaluate future plan, we used the following question. “What is your plan for your future life course?” Participants selected one of seven items: “high school,” “vocational school,” “college,” “university,” “post-graduate school,” “taking a job after leaving the current school,” and “not decided yet.” Those who selected “university” or “postgraduate school” were grouped as students who intended to go to university; otherwise, they were grouped as students who did not intend to go to university or those who had not yet decided [26].

Subjective happiness was measured using a single item: “In general, how would you describe your happiness?” Participants responded on a visual analogue scale. Participants were instructed to (a) focus on their global estimation and general feelings, (b) take note that 0 is the minimum and 10 is the maximum, and (c) select the number that best described their feelings. This single scale has good concurrent, convergent, and divergent validity [28]. Single-item happiness measures have been used widely throughout the world [29, 30]. We defined participants with a score of 3 or less (10th percentile score) as being unhappy [31], because it is quite plausible that data on lower levels of happiness scores (that is, unhappiness) could help to identify groups or problems that are potential priorities for policy interventions. Thus, subjective unhappiness was dichotomously scored (unhappy = 1, other = 0).

Data analysis

First, we examined participants’ characteristics by school type. Second, we calculated the prevalence and 95% confidence intervals (95% CI) of unhappiness by school grade. Third, we examined the prevalence of unhappiness by lifestyle behaviors and items of Young Diagnostic Questionnaire for Internet Addiction, according to gender and school type, by using the χ^2 test. Finally, we analyzed a multivariable logistic regression, calculating the adjusted odds ratios (ORs) of each factor and its 95% CI for subjective unhappiness. The covariates in the logistic regression analysis included basic demographic characteristics (gender and school grade), lifestyle behaviors (having breakfast, drinking alcohol, smoking status, sleep quality, and Internet usage), and school life (extracurricular activities and intending to study at university). To determine covariates, we referred to factors associated with happiness in previous studies [14, 15, 17, 24]; these behaviors are factors of high interest to national policies as well as teachers and parents as intervention goals. The statistical level of significance was $p < 0.01$. Statistical analyses were performed with Stata 15.1.

Ethics statement

In the Ethical Guidelines for Epidemiological Studies jointly announced by the Ministry of Health, Labour and Welfare and the Ministry of Education, Culture, Sports, Science and Technology of Japan, personal information is defined as follows: information of a living individual,

and the name, birthday, and other descriptions included in that information that can be used to identify a specific individual. We used questionnaires devoid of all such information to prevent participant identification and to safeguard their privacy. We obtained written informed consent from all participants. Limited to junior high school students, informed consent was obtained from each child's parent or guardian. According to the Ministry of Health, Labor and Welfare's epidemiology ethical guidelines, researchers are not required to obtain parental approval in a non-invasive survey of high school students. This study was approved by the ethical review board of the Tottori University School of Medicine.

Results

Table 1 shows the participant demographics by school type. The prevalence of subjective unhappiness was 9.3% and 10.2% in junior and senior high school students, respectively. Students in junior and senior high schools who wished to go to university accounted for 61.2% and 55.5%, while 65.3% and 51.8% actively participated in extracurricular activities, respectively. Most junior and senior high school students ate breakfast daily (85.9% and 81.5%,

Grade 12	13,404	10.5	9.9	11.0	
Total	63,945	10.2	9.9	10.4	

Participants with missing data were excluded from the analysis.

P-value was calculated with chi-square test by grade.

Unhappiness was defined as a score of 3 or less on an 11-point scale.

<https://doi.org/10.1371/journal.pone.0235252.t002>

Fig 1 shows the prevalence of subjective unhappiness in lifestyle behaviors and school life by each school type and gender. Among junior and high school students, factors that had significantly a higher prevalence of subjective unhappiness were having breakfast sometimes/seldom, passive participation in extracurricular activities, present smoking, present alcohol use, poor sleep quality, and not yet having decided to study at university. These variables showed no significant differences by gender among both school levels.

Tables 3 and 4 show the prevalence of subjective unhappiness in items by each school type and gender. In all YDQ items, the prevalence of unhappiness among those who answered “Yes” was higher than that among those who answered “No.” In particular, items with a large difference in the prevalence of unhappiness were “Need to use the Internet with increasing amounts of time to achieve satisfaction,” “Restless, moody, depressed, or irritable when attempting to cut down or stop Internet use,” “Jeopardized or risked the loss of significant relationship, school, educational or club activity because of the Internet,” and “Use the Internet as a way of escaping from problems or of relieving a dysphoric mood.”

Table 5 shows the crude and adjusted ORs (AORs) and 95% CIs for the association between unhappiness and each of the explanatory variables. In this multivariable logistic regression model, the AUC was 0.724 and the pseudo-R squared was 0.093. The analysis revealed higher

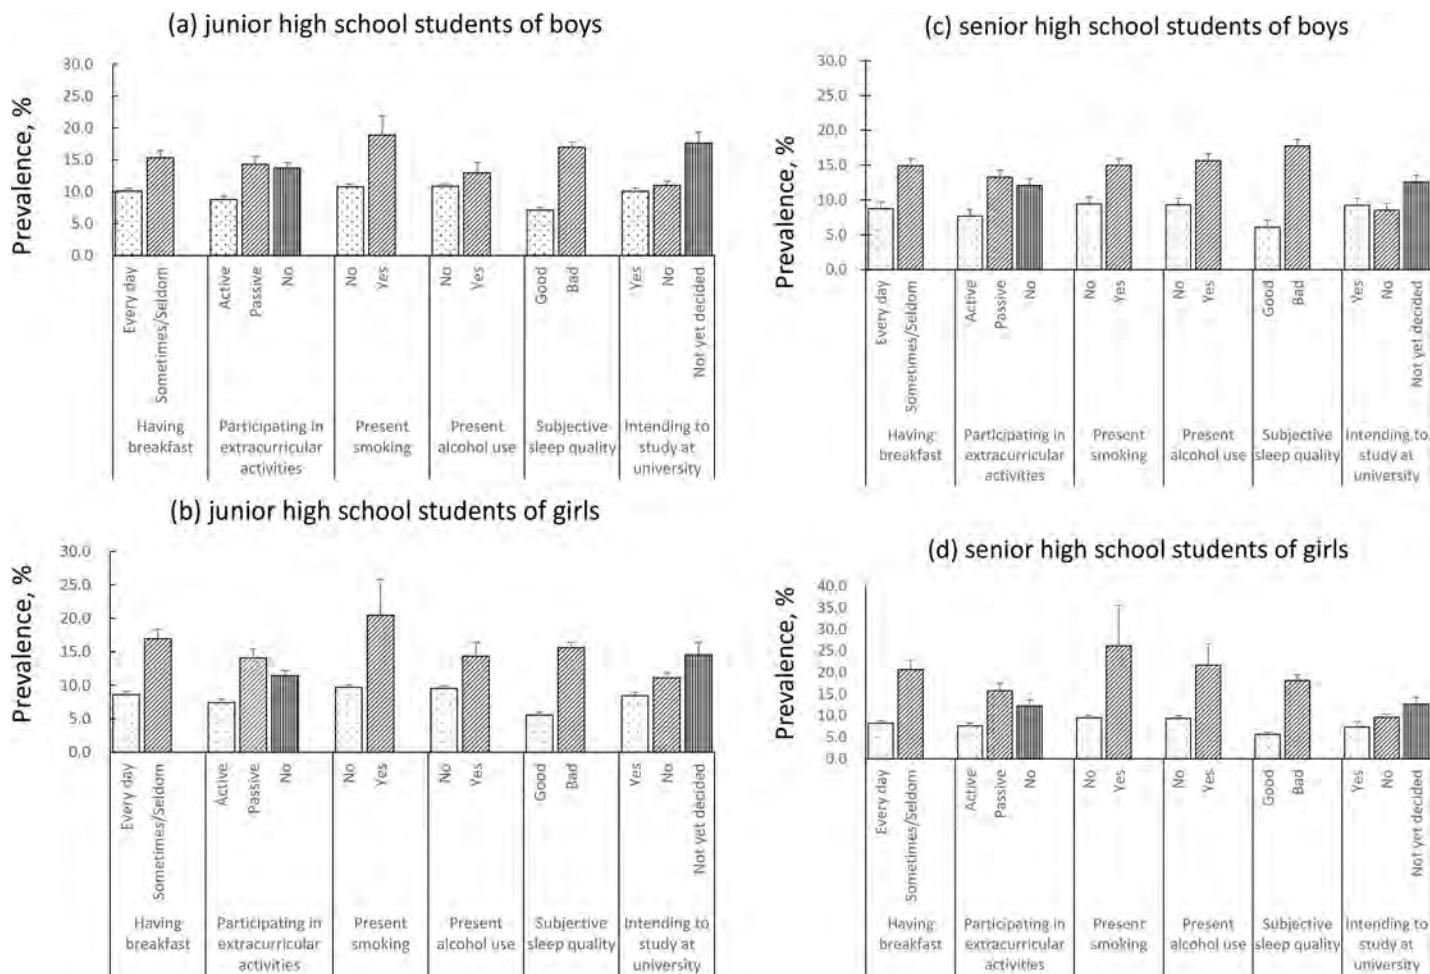

Fig 1. The prevalence of subjective unhappiness in Japanese adolescents by each life style factor. (a) junior high school students of boys (b) junior high school students of girls (c) senior high school students of boys (d) senior high school students of girls.

Discussion

This is the first nationally representative study to examine the association between subjective unhappiness and daily lifestyle factors such as having breakfast, extracurricular activity, sleep, and Internet usage in Japanese adolescents. The results demonstrated that unhappiness was significantly positively associated with passive participation or lack of participation in extracurricular activities, poor sleep quality, and some aspects of problematic Internet usage. On the other hand, unhappiness was significantly negatively associated with being a girl, eating breakfast daily, intending to study at university, and a few problematic Internet usage patterns. The results were nearly identical with previous research in other countries and confirmed our hypothesis except the lack of effects on class grades. These findings provide important evidence on the ways that lifestyle interventions could improve overall happiness in adolescents in Japan.

We found that there were unhappier boys than girls in Japan. Gender differences in subjective happiness and well-being have been reported in both Western and Asian countries [14]. Male Chinese adolescents had 1.05-fold greater odds of being unhappy than did their female counterparts [13]. This difference might be attributed to women having higher resilience than men [32]. However, an Australian study reported that no gender differences in subjective well-

Table 5. Logistic regression results: Variables associating unhappiness in Japanese adolescents.

being were found among high school students [33]. Our present study has unequal ratios between male and female samples and should be standardized in future studies. Thus, the gender difference in adolescent happiness remains unclear. Adolescence is a period of profound change (e.g., hormonal balance, cultural and social influences), which future studies should examine. Liu also reported that, as boys get older, their happiness falls significantly; girls, however, are unaffected [34], which coincides with our findings. No prior studies were available to investigate whether this difference lasts into adulthood. Longitudinal research is needed to examine changes in subjective happiness over time in males and females.

Our raw data showed that students' grade in school was associated with unhappiness. However, our multivariate logistic regression analysis found no association between grade level and unhappiness. Research on adolescents in China [13], Chile [14], and Europe/North America [35] reported that the risk of unhappiness increased with age. Thus, we predicted that as students move up in grade, their proneness to unhappiness would increase (due to the added burden of cram schools, after-school activities, longer commuting hours, and less free time). One reason for the discrepancy in our results could be that some of the explanatory variables were confounders between class grades. A second reason may be related to the Japanese education system, which has students prepare for academic entrance exams in grades 9 and 12. Thus, students are under constant academic pressure. Furthermore, even when the academic pressure lessens, students engage in extracurricular activities; thus, they have little free time regardless.

Not eating breakfast regularly was associated with an increased risk of unhappiness. A cross-sectional study of Chilean university students similarly revealed that happiness was positively associated with regularly eating breakfast [14]. Possibly, breakfast consumption helps maintain normal weight status in adolescents [36]. Given that obesity has a negative effect on subjective happiness [37], eating breakfast might be related to subjective happiness via weight management.

Surprisingly, a passive attitude toward extracurricular activities had a stronger correlation with unhappiness than did no participation at all. Extracurricular activities often involve interaction with individuals with similar objectives and interests [38]. Students with passive attitudes might be unable to commit to these objectives and interests, thus making them feel more isolated within a group. Most Japanese junior and senior high school students are obligated to participate in extracurricular activities. They are often extremely busy with extracurricular activities, which typically occur from early morning until late at night, and frequently on weekends. Therefore, students are unlikely to feel happy if they are not interested in these activities. Given this result, educators need to change the way students participate in extracurricular activities.

The hope to study at university in the future was associated with a decreased risk of unhappiness. We might attribute to this to the fact that individuals who advance to university-level education set goals for themselves, achieve relatively good grades [39], or have a positive home environment [11], all of which may make them more unlikely to become unhappy.

These two factors (participation in extracurricular activities and intend to study at university) seem to be related to freedom of choice. Those who are passively participating are supposed to escape from their activities. However, they are considered to be in a situation where they are forced to participate because they are bound by the relationships between their neighbors and the rules of the school. Therefore, students who participate passively in extracurricular activities have a higher odds ratio of unhappiness than students who do not participate. In addition, it can be seen that the reason for not intending to study at university is that the options for the future are narrowed, such as having to work due to economic circumstances or having no interest in study. Just as discretion is one of the key work engagement factors for

workers [40], freedom of choice may be a related factor of happiness. Future research requires a longitudinal study of how self-determination is related to happiness.

Interestingly enough, the multivariable logistic regression results showed there were no statistical associations of drinking alcohol and smoking with unhappiness. Both negative correlations between smoking and happiness [13, 41] and no correlation [14, 42] have been found in previous longitudinal studies. Thus, we cannot conclude definitively whether a correlation exists or not. Similarly, there are no consistent findings on the correlation between drinking alcohol and happiness [13, 14, 42]. A notable difference between this study and past ones is that the prevalence of smoking and drinking among Japanese junior and senior high school students is decreasing [43, 44]; currently, these prevalence rates are extremely low, and the population of drinkers was not stratified in this study. Furthermore, in Japan, it is illegal for people below 20 years of age to smoke and drink alcohol; therefore, students often refuse to respond to questions on smoking and drinking.

In particular, poor sleep quality was associated with higher risk for unhappiness. A longitudinal study of adults found a J-shaped relationship between happiness and sleep duration [45], indicating that subjective unhappiness decreased with sleep duration. This finding suggested that getting enough sleep was associated with increased happiness. However, few studies have examined the correlation between sleep and happiness among adolescents. Roberts et al. reported that those with insomnia have 3.27-fold higher odds of identifying themselves as unhappy compared to those who do not have insomnia [46]. In contrast, a cross-sectional study of 750 Americans aged 14–15 years revealed that happiness had a significant correlation with daily activities such as studying, communicating with friends on screens, and spending time with family, but not with sleep deprivation [47]. Further research on the relationship between sleeping disorders and happiness is required.

In line with previous research [15–17], we thought that all Internet-dependent items would be positively related factors of unhappiness in adolescence. Surprisingly, our findings showed that a few components of Internet addiction were negatively correlated with unhappiness. These results may suggest that the Internet brings both happiness and unhappiness to adolescents. Similarly, a European pooled cross-sectional dataset showed that Internet usage has been found to correlate positively with well-being [48]. A study of Chinese adolescents revealed that excessive Internet usage provides temporary enjoyment, but ultimately suppresses long-term well-being [17]. A nationally representative yearly survey in the United States showed that American adolescents found that limiting time spent in electronic communication is associated with the greatest happiness levels [49].

Our data did show, however, that the destruction of relationships through Internet use was associated with unhappiness. SNSs like Facebook can generate negative feelings (e.g., jealousy) [50]; constant access to friends' profiles provides people with more in-depth information on others than ever before, but it may cause jealousy and decrease subjective happiness if individuals see friends interacting with ideal figures or role models. Our data also showed that Internet use for the purpose of escape and feeling anxious or depressed by using Internet were associated with unhappiness. Indeed, subjective happiness might be reduced by social isolation, as real relationships become diluted through prolonged Internet use. Adolescents are prone to problematic Internet usage because of their underdeveloped emotional regulation and self-control [51]. Internet addiction does not help adolescents establish interpersonal relationships in the real world. Therefore, given that we live in an Internet-connected world, schools and families need to instruct students on methods of proper Internet usage to maintain adolescents' happiness.

This study has several limitations. First, because this was a cross-sectional study, we cannot determine the causal relationships for each factor, or how these might change over time. Thus,

future studies should use a longitudinal design. Second, we could not collect data from students who were absent from school on the survey day as well as school dropouts. The prevalence of unhappiness might be even higher among absentees and dropouts when compared to those in attendance on the day of the study. Similarly, the data of the explanatory variables might have been affected by the exclusion of these individuals. Third, no data were obtained on participants' weight or socioeconomic factors, such as family income or parents' educational levels. Some studies have highlighted the importance of socioeconomic status for subjective happiness [52], whereas others have found no relation between social class and subjective happiness [53]. Thus, future research should include socioeconomic factors. Fourth, the response rate in this study was 56.0%; thus, approximately 44% of the students did not participate. There may be two reasons for the non-responsiveness. The first reason is that people below 20 years old in Japan are prohibited by law from smoking and drinking alcohol. Therefore, schools and students tend to be non-cooperative in responding to a survey that includes questions on smoking and drinking alcohol. The second reason is the epidemiological survey in Japan required the consent of parents in junior high school students, which can be difficult to obtain. Finally, in this study the effect size, an essential component when evaluating the strength of a statistical claim, was rather small. However, a small effect size can be of great practical value. This is especially true if a treatment is relatively cheap, easy to perform, politically viable, and can be used on a large scale, thereby affecting a large number of individuals [54]. In addition to that practical value, this study had three main strengths: 1) it is a nationwide survey; 2) it has an extremely large sample; and 3) it has a survey response rate over 50%, which was high for this type of epidemiological study. These strengths provide increased credibility in our results by minimizing the impact of potential random errors from self-reporting, especially among adolescents.

Conclusions

This large-scale Japanese adolescent study showed that unhappiness was strongly associated with being male, engaging in unhealthy lifestyle behaviors (e.g., not having breakfast, poor sleep quality), and worrisome Internet usage patterns. Given that our study showed that passive participants in extracurricular activities were less happy, education officials should consider whether to require such activities. Teachers and parents should emphasize the importance of sleep and ensure that adolescents are able to get the sleep they need. Further, schools and families should instruct students in how to use the Internet and provide limits to Internet use. Our findings can help inform future government policies and help teachers and parents promote good quality of life among adolescents.

Acknowledgments

We thank the schools and students for participating in the survey.

Abstract

Background: In areas affected by the tsunami of the great East Japan Earthquake, smoking behavior may have deteriorated due to high stress and drastic changes in living environment. Surveys were conducted to reveal changes in smoking behaviors among victims.

Methods: A population-based random-sample home-visit interview survey of victims in Iwate and Miyagi Prefectures affected by the tsunami disaster was conducted in 2012 ($n = 1978$), while a population-based nationwide survey was conducted in 2013 ($n = 1082$). A panel survey in 2014 was conducted with respondents of the 2012 survey ($n = 930$). Multiple logistic regression analysis was performed to reveal factors related to smoking status after the disaster.

Results: There was high smoking prevalence of both sexes in the tsunami disaster area (current smoking rate in coastal area, 50.0% for male, 21.4% for female; inland area, 34.7% for male, 7.6% for female). Low prevalence of male quitters was observed (quitter rate in coastal area, 20.8% for male, 8.0% for female; inland area, 23.4% for male, 5.5% for female). The prevalence of nicotine-dependent people assessed by FTND (Fagerström Test for Nicotine Dependence) in the coastal area was also higher than in the inland area or other areas of Japan. Smoking behavior among victims worsened after the disaster and did not improve 3 years from the disaster. Post-disaster factors related to smoking were living in coastal area, complete destruction of house, and living in temporary housing.

Conclusions: Smoking prevalence and the level of nicotine dependence of tsunami victims were still high even 3 years after the disaster. It is important to emphasize measures for smoking control in the disaster areas for an extended time period.

Introduction

The great East Japan Earthquake was a magnitude 9.0–9.1 (Mw) undersea megathrust earthquake off the coast of Japan that occurred on March 11, 2011. It was the most powerful earthquake ever recorded in Japan. The earthquake triggered powerful tsunami waves that may have reached heights of up to 40.5 m (133 ft), and which, in the Sendai area, traveled up to 10 km inland. The tsunami swept the Japanese mainland and killed many people, mainly through drowning, though blunt trauma also caused many deaths. The latest report from the Japanese National Police Agency confirmed 15,897 deaths, 6157 injured cases, and 2533 missing cases across twenty prefectures (as of March 8, 2019) [1], and the number of refugees was approximately 347 thousand at its peak in 2012. A 2019 report indicated that approximately 52,000 people were still living away from their homes in temporary housing [2]. The National Police Agency report listed 121,990 buildings as “totally collapsed,” with a further 282,900 buildings “half collapsed” and another 730,044 buildings “partially damaged” [1]. The earthquake and tsunami also caused extensive, severe infrastructural damage in north-eastern Japan. In the 65 years since the end of World War II, this has been the toughest crisis faced by Japan.

In the disaster area, many people were forced to live long term as evacuees in environments different from those of conventional life, such as temporary housing or rental houses. How health-related lifestyle changed after the disaster is important to understand in order to protect the health of the victims. Some reports have indicated that the smoking behavior of victims has changed after natural and human-made disasters: the September 11, 2001, attacks [3–5]; Hurricane Katrina, in 2005 [6, 7]; bushfires around Canberra, in 2003 [8]; and the Enschede fireworks disaster in the Netherlands, in 2000 [9]. However, there are few reports about smoking behavior after an earthquake or tsunami. Some articles on smoking behavior after a New Zealand earthquake have been published [10], and one article reported decreased smoking prevalence among victims in Fukushima Prefecture after the great East Japan Earthquake [11]. However, no article describing smoking behavior among victims in tsunami-damaged parts of Miyagi and Iwate Prefectures has been found. We conducted a survey to identify changes in smoking behavior of victims after the disaster in Miyagi and Iwate Prefectures. The current study hypothesis was that the smoking status of people in the tsunami-damaged area had worsened after the disaster and that had improved subsequently. The study provides findings that stress the importance of improvising measures for smoking control in disaster areas in the long term to reduce future health hazard.

Materials and methods

A population-based random-sample home-visit interview survey of victims in Iwate and Miyagi Prefectures affected by the tsunami disaster was conducted in 2012 ($n = 1978$). In order to compare with the results of the 2012 survey, we conducted a nationwide survey in 2013 except for the three affected prefectures using the same questionnaire ($n = 1082$). A panel survey in 2014 was conducted with respondents of the 2012 survey ($n = 930$). The outline of this study was shown in Fig. 1.

Participants

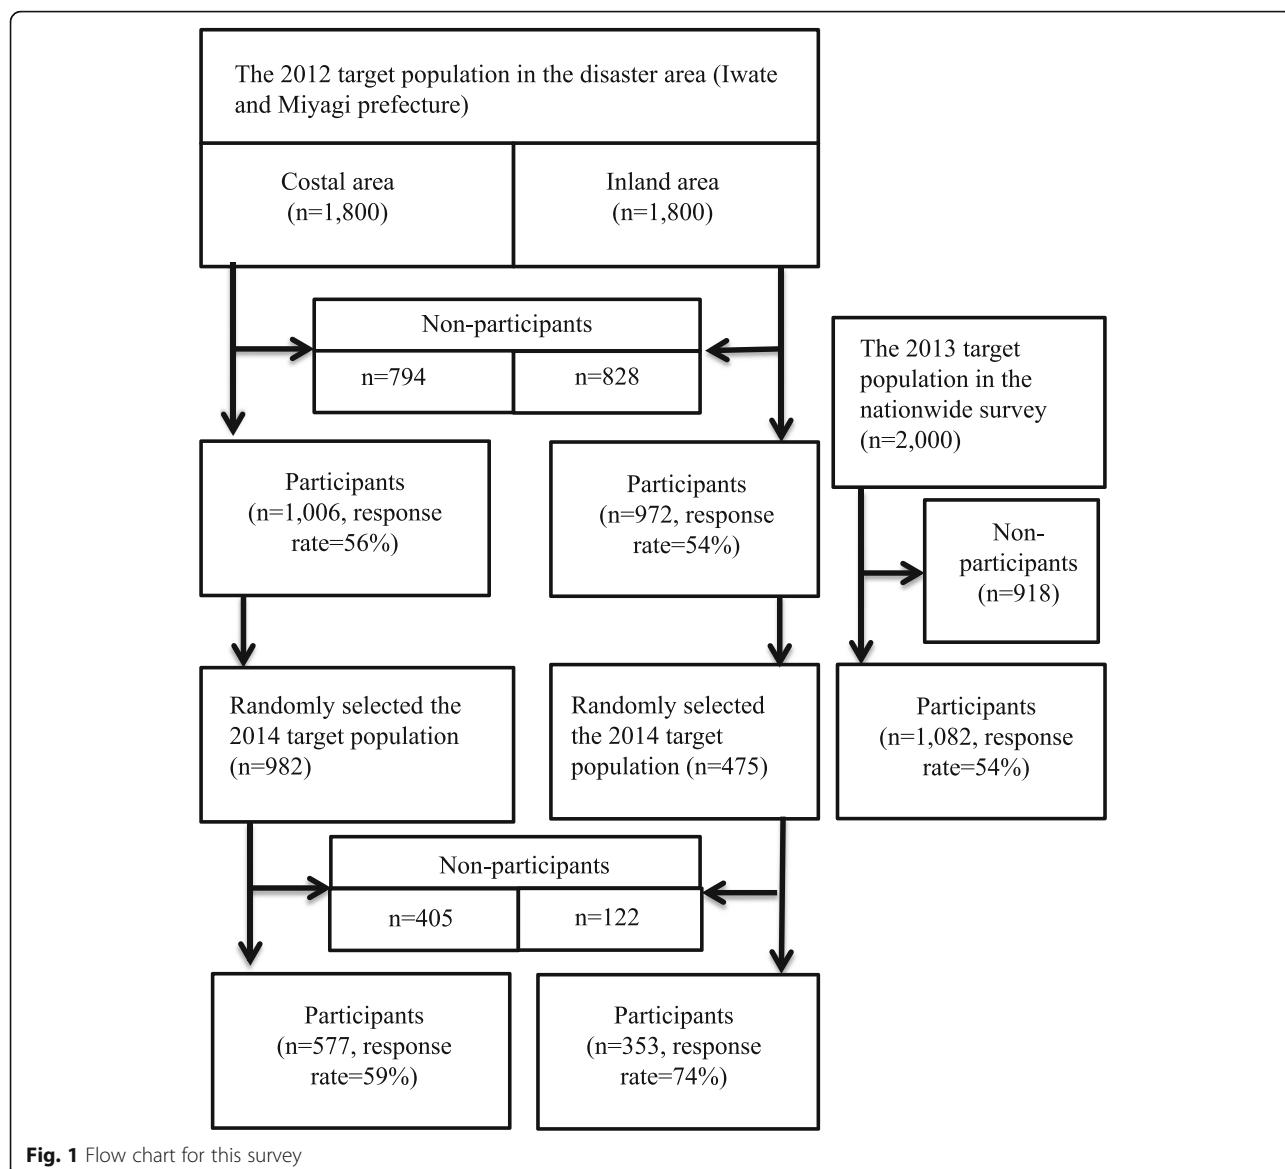

Participants of the present survey were survivors living in the disaster area. This study includes an interview survey conducted in the disaster area in 2012, a panel survey in the disaster area 2 years later and a nationwide survey excluding the disaster area in 2013. The survey in the tsunami disaster area was conducted in the Iwate and Miyagi Prefectures. Fukushima Prefecture was excluded from the survey area, because conducting home visits to administer the interview survey was still difficult at that time, and many people were still living as refugees, distant from their registered addresses. A municipality that had a coastline at the boundary was defined as a coastal area. A municipality that did not have a coastline at the boundary was defined as an inland area. Sendai City of Miyagi Prefecture, which has a large population, defined a ward with coastline at the boundary as a coastal area and a ward without the coastline as an inland area.

Procedures

We randomly selected 1800 people from the coastal area and 1800 people from the inland area in the Iwate and Miyagi Prefectures using the resident registers of local municipalities. Trained investigators requested them for their cooperation and visited participants who had consented to an interview. We entrusted a survey company called the Shin Joho Center to carry out the sample selections and home visit interview surveys. The survey company requested the sampling of residents to the municipalities, and the investigators visited municipal offices and randomly selected residents from the Basic Resident Register. Investigators were 49 well-trained employees of the survey company living in Miyagi and Iwate Prefectures.

The number of respondents was 1006 for the coastal area (56% of response rate and 58% of actual response rate excluded by moving, address unknown, and long-time absent) and 972 for the inland area (54% of response rate, 59% of actual response rate). The survey period was November to December 2012.

We then conducted a national survey on smoking behavior to compare with the findings from the disaster area; hence, the national survey excluded the three

disaster-hit prefectures (Iwate, Miyagi, and Fukushima). We randomly selected 2000 people by two-stage random sampling based on the points and the resident registers. We obtained answers from 1082 people (54% of response rate, 59% of real response rate; including one incomplete questionnaire). The survey period was from November to December 2013. The content of the questionnaire was similar to that of the 2012 survey conducted in the disaster area. The 2014 survey was conducted with the respondents of the 2012 survey, though funding limitations meant only half as many participants in the inland area could be interviewed. Thus, 982 people from the coastal area and 475 people from the inland area (total of 1457) were asked to take the second survey, and 577 (59% of response rate) and 353 people (74% of response rate) agreed to do so (a total of

930 respondents). The survey period was from November to December 2014. Many respondents who were registered in the coastal area in the 2012 survey could not be contacted in 2014 survey: 199 people had moved to unknown places; 40 people were absent for a long time, and the addresses of 19 people were not exist out of 982 coastal samples. The actual response rate for the coastal area was 80%, similar to the 84% for the inland area.

Measures

The survey covered current smoking status, nicotine dependence (FTND, Fagerström Test for Nicotine Dependence; TDS, Tobacco Dependence Screener) [12, 13], damage or challenges due to the situation during and after the tsunami and earthquake, and sociodemographic factors. Smoking status was classified into three groups

(current smoker, ex-smoker, never smoker) according to the two questions: "Have you ever smoked a conventional cigarette more than 100?", and "Did you every day or sometimes smoke cigarettes for this one month?"

FTND scale contains six items that evaluate the quantity of cigarette consumption, the compulsion to use, and dependence. Questionnaires are as follows. (1) How soon after you wake up do you smoke your first cigarette? (2) Do you find it difficult to refrain from smoking in places where it is forbidden? (3) Which cigarette would you hate most to give up? (the first one in the morning or any other cigarette), (4) How many cigarettes per day do you smoke? (5) Do you smoke more frequently during the first hours after waking than during the rest of the day? (6) Do you smoke when you are so ill that you are in bed most of the day? For scoring of FTND, yes/no items are scored from 0 to 1, and multiple-choice items are scored from 0 to 3. The items are summed to yield a total score of 0–10. The higher the total score, the more intense is the patient's physical dependence on nicotine.

The indexes used for the analyses were the mean of FTND, the proportion of persons with moderate or severe nicotine dependence (scores higher four points) as per FTND, the proportion of persons with severe nicotine dependence (more than seven points) as per FTND, the mean of TDS, and the proportion of person with nicotine dependence as per TDS (more than five points). Exacerbation of the smoking status in the panel survey is that never smokers or ex-smokers become current smokers, and improvement of the smoking status is that current smokers become ex-smokers. AUDIT (Alcohol Use Disorders Identification Test) was used as a screening test for alcoholism [14]. It is said that the cut-off point of AUDIT varies from country to country, and studies conducted in Japan have used more than 12 points for problem drinking and more than 15 points for alcohol dependence [15].

Data analysis

For statistical testing for means, the *t* test was used for the analysis, and the paired *t* test for the comparison of

2012 with 2014 results. For statistical testing for proportions, the chi-squared test was used to test the difference in proportion of 2012 and 2014. When the expectation numbers for chi-squared test are small, we used a Fisher's exact test. We conducted multiple logistic regression analysis using the variable increase method by the likelihood ratio. We conducted multivariable analysis with smoking status or dependence status as a dependent variable. The dependent variable was current smoking in 2012 or 2014, and independent variables were coast area/inland area, sex, age, years of education, marriage status, employment status, and damage due to the disaster (as of 2012 or 2014). Because the association between candidate factors was strong especially for damage due to the disaster, the statistical analysis to examine each factor was repeated using a statistical model including sex, age, and each candidate factor. We analyzed data with personal information removed, using SPSS Ver. 24 (IBM SPSS, Chicago, IL, USA).

Results

The current smoking rate in the coastal area affected by both the earthquake and the tsunami was 50.0% for male and 21.4% for female participants in 2012, higher than in the inland area affected by the earthquake only (34.7% for male and 7.6% for female). Smoking prevalence in the coastal area was higher than that in the nationwide survey in 2013 (31.2% for male and 10.6% for female) (Table 1).

The proportion of quitters in the coastal area in 2012 was 20.8% for male and 8.0% for female, whereas that in the inland area was 23.4% for male and 5.5% for female. These figures in coastal area were statistically similar to those in the inland area, and the figure for males in coastal area was statistically lower than the figure from a nationwide survey in 2013 (30.5% for male and 7.7% for female).

The prevalence of people with nicotine dependence in the coastal area in 2012 according to the FTND test was 8.7% for severely dependent males and 29.4% for moderately dependent males and 2.8% for severely dependent

Table 1 Smoking status by area (disaster area in 2012, all Japan in 2013)

	male (n=436)	female (n=570)	male (n=426)	female (n=546)	male (n=493)	female (n=588)
20–29	47.1	11.8	34.5	13.8	37.5	6.3
30–39	60.0	8.0	34.5	15.5	44.4	20.4
40–49	64.2	15.1	25.6	11.0	41.1	21.4
50–59	51.6	25.8	33.3	5.6	46.9	20.3
60–69	47.2	22.8	12.8	1.6	27.0	33.3
70–79	32.4	35.1	3.8	3.2	11.4	39.2
80 and over	26.8	46.3	2.1	6.3	20.0	23.3
crude rate	45.0	26.4	17.2	6.3	31.5	26.5
adjusted rate	50.0	20.8	21.4	8.0	34.7	23.4
95% CI	(49.2–50.9)	(20.3–21.3)	(21.0–21.9)	(7.8–8.3)	(34.0–35.3)	(23.0–23.9)
testing (vs. Japan)	p<0.01	p<0.01	p<0.01	p=0.34	p=0.55	p<0.01
testing (vs. inland)	p<0.01	p=0.40	p<0.01	p=0.27	p=0.14	p=0.11

Adjusted rate was calculated using the 2012 national population. CI confidence interval

females and 11.0% for moderately dependent females, whereas that in the inland area was 4.4% and 16.1% for males and 0.6% and 3.9% for females. The figures in the coastal area were statistically higher than those in the inland area (Table 2); they were also significantly higher than those from the nationwide survey in 2013 (2.6% and 15.3% for males, and 0.3% and 3.4% for females).

When we calculate change in smoking status between 2012 and 2014 among respondents to both surveys, respective rates of no change, improvement, and aggravation were 88.8%, 3.0%, and 8.2% for coastal males and 94.5%, 2.3%, and 3.2% for coastal females, while they were 96.2%, 1.3%, and 2.5% for inland males and 97.4%, 2.0%, and 0.5% for inland females. There were fewer persons with no change of smoking status in the coastal area compared with the inland area, and the rate of aggravation tended to be higher in coastal areas than in inland areas (Table 3).

When we calculate change in nicotine dependence between 2012 and 2014 in the disaster area, we see no change, improvement, and aggravation at 84.7%, 9.4%, and 5.8% respectively for coastal males and 94.3%, 3.3%, and 2.4% for coastal females, whereas those figures are 84.8%, 5.7%, and 9.6% for inland males and 98.5%, 1.0%, and 0.5% for inland females. The rate of aggravation thus tended to be higher in coastal females and inland males (Table 4).

We applied multivariable analysis to examine factors associated with smoking behavior. In a statistical model explaining smoking status in 2012 (with covariates as of 2012), statistically significant risk factors for current smoking in 2012 were living in coastal area, divorce, under 9 years of education, unemployment, complete destruction of house, living in temporary housing, problem drinking (AUDIT score 12 points and over), and pathological gambling; a protective factor was professional agriculture, forestry, or fishery engagement (Table 5). The results of the multivariate analysis, which took into account the model fitness, showed that the complete destruction of houses was a significant risk factor.

In the statistical model explaining smoking status in 2014 (with covariates as of 2014), significant risk factors

for current smoking were coastal area, divorce, temporary housing, and prescribed drug dependence, while a protective factor was complete destruction of house. The results of the multivariate analysis, which took into account the model fitness, showed that the coastal area, divorce, complete destruction of houses, and temporary housing were significant risk factors.

In the statistical model to explain smoking status in 2014 with covariates as of 2012, the statistically significant risk factors were coastal area, divorce, under 9 years of education, complete destruction of house, temporary housing, and problem drinking (AUDIT score 15 points and over). In the statistical model explaining aggravation of smoking status in 2014 with covariates in 2012, the no statistically significant factors were found. However, the factors costal area, divorce, losing job by the disaster, complete destruction of house, temporary housing, and loss of family member tended to be risk factors for worsening smoking status. The results of multivariate analysis with the dependent variable replaced by nicotine dependence assessed by FTND or TDS were similar to these results ([supplement tables](#)).

Discussion

This study has revealed the high smoking rate among both sexes in the tsunami disaster area after the great East Japan Earthquake and the low prevalence of male quitters in the area. The prevalence of nicotine-dependent people in the area was also higher than in the inland area or in other areas of Japan. The differences in prevalence were quite large. The high smoking rate and the rate of nicotine dependence in the coastal disaster area might have already been present in this area—coastal Tohoku region. Because there were no data before the earthquake disaster, we divided data from the nationwide survey in 2013 into respondents who lived under non-coastal and coastal local governments and compared the prevalence of smoking and nicotine dependence. There was no statistically significant difference in prevalence between these two areas. This

NS non-smoker

suggests that the prevalence of smoking and nicotine dependence in the coastal area was elevated after the tsunami disaster and had not improved 3 years after the disaster. This health-related behavior may create and exacerbate future health problems in the disaster area.

Several articles on smoking behavior after disasters have been published. Smoking behavior before and after the 9/11 terrorist attacks was studied through a telephone survey, which found a higher smoking rate after the attacks [3]. In addition, low smoking cessation rate was reported among affected residents [4], rescue workers, and police officers with PTSD after the attacks [5]. It has been reported that high smoking rates and worsening of smoking status among residents are strongly related to posttraumatic stress disorder (PTSD) and major depression [16, 17].

High smoking prevalence among victims of Hurricane Katrina was also reported [6, 7]. A study on victims of Hurricane Katrina reported that PTSD and depressive symptoms are associated with smoking relapse [18]. There is a report that psychological distress after the disaster is not associated with worsening smoking behavior (increase of daily cigarette intake and nicotine dependence) [19]. In addition, the cigarette consumption was reported to increase after the Australian bushfires [8], while a follow-up study of the victims of the fireworks disaster reported that smoking became a predictor of mental disorder [20].

Previous articles related to change in smoking behaviors after an earthquake in New Zealand have been published; elevated smoking prevalence and nicotine dependence also were reported [10]. One article also claimed that there was a relationship between smoking behavior and PTSD (posttraumatic stress disorder) symptoms among Swiss victims of the Indian Ocean tsunami of 2004 [21]. As described above, there are many reports that the smoking prevalence and nicotine dependence of victims increases after natural disasters.

There are few articles reporting smoking behavior among victims by the tsunami after the great East Japan Earthquake. According to a report from Fukushima, few people started smoking after the disaster; the smoking rate was not high among victims in 2012 compared with smoking rate among the general population, and smoking rate decreased after the disaster [11]. A longitudinal study of elderly people in Iwate Prefecture from 2012 to 2015 found that smoking prevalence was higher among people with complete destroyed houses and that continued decreasing from 2011 through 2014 and increased in 2015 [22].

Although the Fukushima study was conducted on a large-scale, the response rate was low (41%); moreover, the study was cross-sectional rather than longitudinal. The Iwate study was limited to the elderly. The strengths of the present study are that it included the coastal, tsunami-hit area; participants were randomly sampled

and included people aged 20 years and older; home visits were conducted for the survey interview; a nationwide survey was conducted for comparison; and some respondents were surveyed twice (longitudinally). Thus, this study was able to reveal changes in smoking behavior after a tsunami disaster, which worsened initially and did not improve 3 years later because of the protractedly damaged and difficult life situation that respondents were still facing due to the earthquake and tsunami. Although the results of current study are not similar to other reports from Japan, they are similar to results from other countries about smoking behavior after disasters.

There are reports that the prevalence of posttraumatic stress reaction and depressive reaction among resident survivors after the tsunami following the great East Japan Earthquake was high, and these symptoms were related to house flooding [23, 24]. There is a report that 3 years after the disaster, the depressive symptoms of survivors with loss of loved ones have recovered, but those have prolonged among survivors with property loss [25].

Therefore, it can be inferred that the high smoking rate and nicotine dependence observed in the current study have occurred through psychological distress due to damaged houses and long-term evacuation life caused by the tsunami. The smoking behavior may have been due to stress from crowding living conditions and interaction among the inhabitants of the temporary housing. Treatment for quitting thus be important for health care in temporary housing. In general, socioeconomic conditions, such as education level, income, and working conditions, are also related to smoking behavior [26, 27]. This study has revealed that the destruction of the house and subsequent temporary housing life after the disaster become important risk factors for smoking behavior even after adjusting for these socio-economic factors by multiple logistic regression analyses.

The present study has some limitations. First, the study participants did not include inhabitants of the Fukushima Prefecture. The sampling of participants from the Fukushima Prefecture was difficult because

many evacuated people lived far away from their registered addresses. Second, the response rate relatively low. However, there are many inaccessible residents, and many people were exhausted from surveys by various researchers. Response rate of this survey was high one for surveys in the disaster areas because of the home visit interviews. Third, the follow-up survey was carried out only 2 years later. Since the research funds were limited, we could conduct the survey only twice. Fourth, the smoking status before the disaster is unknown; this is because survey was conducted after the disaster. We conducted a nationwide survey, excluding the three disaster prefectures, in 2013 using same survey methods and questionnaire, and compared the results with the results from the disaster areas, so that we were able to confirm that high smoking rate was a phenomenon persistent only in disaster areas.

Conclusions

As shown in this study, smoking behavior and nicotine dependence worsened among victims of the tsunami disaster after the great East Japan Earthquake and had not improved after 3 years. In particular, the smoking behavior of inhabitants living in temporary housing is serious. The findings of this study stress the importance of improvising measures for smoking control in disaster areas in the long term to reduce future health hazards.

Heat-not-burn tobacco, electronic cigarettes, and combustible cigarette use among Japanese adolescents: a nationwide population survey 2017

Yuki Kuwabara^{1*} Aya Kinjo¹, Maya Fujii¹, Aya Imamoto¹, Yoneatsu Osaki¹, Maki Jike², Yuichiro Otsuka², Osamu Itani², Yoshitaka Kaneita², Ruriko Minobe³, Hitoshi Maezato³, Susumu Higuchi³, Hisashi Yoshimoto⁴ and Hideyuki Kanda⁵

Abstract

Background: From among the global public health concerns, smoking remains one of the most crucial challenges. Especially for adolescents, the increase in the use of electronic cigarettes is controversial, as its use may lead to established smoking. In Japan, where a unique tobacco regulation system exists, the heat-not-burn tobacco market has been growing. However, the prevalence and association of combustible cigarettes and new tobacco-related products have not yet been closely investigated among Japanese adolescents. This study aimed to clarify the prevalence of smoking among adolescents, including new types of tobacco-related products, and to compare the characteristics of their users.

Methods: The 2017 Lifestyle Survey of Adolescents is a nationally-representative survey collected in Japan. From the national school directory, 98 junior high schools and 86 high schools were randomly sampled throughout Japan. The students completed an anonymous questionnaire at school. We calculated the prevalence of use for each type of tobacco product. Then, the use of a combination of products and the characteristics of different types of products were examined.

Results: In total, 64,152 students from 48 junior high schools and 55 high schools were included in the analysis (school response rate = 56%, $M_{age} = 15.7$ years, 53.9% boys). The age-adjusted rate of ever (current) use of electronic cigarettes was 2.1% (0.7%) in junior high school and 3.5% (1.0%) in high school; that of combustible cigarettes was 2.6% (0.6%) in junior high school and 5.1% (1.5%) in high school. The rate of heat-not-burn tobacco use was lower relative to other products: 1.1% (0.5%) in junior high school and 2.2% (0.9%) in high school. An examination of the combined use of the three products identified a high number of dual users. Comparisons between different types of users indicated different backgrounds for combustible cigarette users and new product users.

(Continued from previous page)

Conclusions: The prevalence of new tobacco-alternative products is growing in popularity among Japanese adolescents. Dual use is common, and many adolescents use new products only. Moreover, e-cigarettes might attract a broader range of groups to smoking. Continuous monitoring and research are needed to investigate their influence as a possible gateway to tobacco smoking.

Keywords: Cigarette smoking, E-cigarettes, Tobacco use, Adolescents, Smoking, Heat-not-burn tobacco, Prevalence

Background

Smoking is a preventable health risk factor that results in numerous diseases and deaths [1, 2]. Smoking control is particularly critical among adolescents, as individuals who use tobacco at a young age are at a considerably higher risk of becoming subsequent smokers [3]. Moreover, tobacco can be a gateway to other types of drug dependence [4]. Therefore, smoking control during adolescence is a crucial public health issue. The National Health Promotion Act has focused on tobacco control, and the prevalence of adolescents who report having smoked combustible cigarettes within last 30 days has continued to decline from 2000 to 2014; 9.4/5.6% (boys/girls) to 1.3/0.6% in junior high school students and 29.9/13.1% to 3.5/1.5% in high school students [5]. However, in recent years, tobacco industries have begun selling new tobacco-related products such as electronic cigarettes (e-cigarettes) and heat-not-burn (HNB) tobacco as alternatives to combustible cigarettes [6].

E-cigarettes use a battery to heat a cartridge containing a liquid, generating steam (i.e. smoke from burning is not generated) [7, 8]. E-cigarettes were first launched in China in 2003, and their consumption has shown a global growth through intense promotion via media geared towards young people, such as YouTube [9, 10]. In smoking surveys worldwide, a rapid rise in the use of e-cigarettes has been seen among adults and adolescents [11–13]. Some of the purported benefits of e-cigarettes are that fewer harmful substances are generated compared to combustible cigarettes [14, 15] and that they can lead to the reduction or cessation of combustible cigarette use. However, there is a concern, particularly for adolescents, that the use of e-cigarettes may cause an increase in established smokers in the future [16]. Moreover, the longitudinal health impact of e-cigarettes has not yet been sufficiently clarified [17]; thus, its use involves potential harm. In Japan, the emergence of e-cigarettes was evaluated by the authorities, and the sale of e-cigarettes containing nicotine is prohibited by the Pharmaceutical Affairs Law of 2010. However, e-cigarettes without nicotine are accessible to adolescents and youth because they are not covered by this law.

HNB tobacco, also known as the 'I-quit-ordinary-smoking' (IQOS) system, involves an electronic device that heats tobacco leaves in a stick, and the user inhales

the generated aerosol instead of smoke [18]. Tobacco companies in Japan are promoting HNB tobacco as a cigarette that causes less harm to users and bystanders. Philip Morris International (PMI) petitioned the US Food and Drug Administration for approval of HNB tobacco products as a smoking cessation tool, but the application was declined. In 2014, PMI introduced IQOS only in Japan and Italy and was available in 37 countries by August 2018. Japan is the unique country in which HNB tobacco was legally sold nationwide under the Tobacco Industries Act, making it an important market for companies that produce HNB products [19]. The popularity and use of HNB tobacco have increased [20]; in October 2016, Japan comprised 98% of the worldwide IQOS sales [21]. Other HNB products include Japan Tobacco's Ploom TECH (2016) and British American Tobacco's Glo product line (2016). Thus, tobacco companies are looking to expand their market offerings [22].

In Japan, where there is a unique market for tobacco-related products, reports on the prevalence of e-cigarette and HNB tobacco use are limited to Internet surveys targeting individuals aged over 18 [23]. As the rapid increase in the popularity of e-cigarettes among adolescents in other countries and of HNB tobacco use in Japan, investigating the prevalence of new products among adolescents is important. Thus, from the 2017 Lifestyle Survey of Adolescents, we obtained data on junior high and high school students' smoking habits and their use of the new types of tobacco-related products in Japan. Our study aimed to clarify the prevalence of smoking of combustible cigarettes and new tobacco products, as well as the combined use of these products and to compare the background of adolescent users of different types of products.

Methods

Study population

This study aimed to evaluate the nationwide prevalence of use of cigarettes and alternative tobacco products. Considering sampling bias, this study involved a cross-sectional random sample survey with single-stage cluster sampling [24], wherein the school was set as the cluster unit. Using the national school directory, junior high schools attended by students aged 12 to 15 and high schools, attended by students aged 15 to 18, throughout Japan were randomly selected, and the survey was

distributed to all students in these schools in 2017. A total of 98 of Japan's 10,325 junior high schools and 86 of the 4907 high schools were sampled. The proportion of private schools was 8.2% of junior high schools and 19.8% of high schools. The survey period was from December 2017 to February 2018.

Data collection

We asked the school principals for cooperation and sent the survey forms to them for distribution to students through class teachers, who explained to the students that participation was voluntary and that they should answer honestly. The students were given anonymous questionnaires and envelopes, which were completed and sealed by the students, collected by their teachers, and then returned to our research office with the seals intact. This survey was approved by the Ethics Review Committee of Tottori University Faculty of Medicine.

Measures

The questionnaire survey focused on adolescents' lifestyle, such as smoking behaviour, alcohol use, and school life (Additional File 1). Referring to the questionnaires used by Centers of Disease Control and Prevention and WHO [25, 26], the questions about smoking included experience with and frequency of combustible cigarette smoking: 'Have you ever smoked a combustible cigarette including even a single puff?' and 'How many days have you smoked combustible cigarettes in the previous 30 days?'. Similar questions were used for new tobacco-alternative products. *Ever users*, *current users*, and *daily users* were defined as those who had smoked even once in the past, had smoked at least once in the past 30 days, and had smoked every day for the past 30 days, respectively. These definitions of frequency were also used for users of e-cigarettes and HNB tobacco.

Tobacco products

Since we needed to discriminate between combustible cigarettes and new tobacco-alternative products, in the questionnaire, we described a combustible cigarette as 'a cigarette made from rolled paper and tobacco and smoked with fire'. Due to the number of e-cigarette brands currently for sale, we used the names of the most popular brands in the questionnaire, stating 'electronic cigarettes include brands such as フレヴォ (FLEVO), エミリ (EMIL), ビタフル (VITAFUL), and ビタシグ (VITASIG)'. The question for HNB tobacco also included product names to avoid any confusion: 'heat-not-burn tobacco is any product such as アイコス (IQOS), ブルームテック (Plume Tech), or グロー (glo)'.

Data analysis

The age-adjusted prevalence rates were calculated using the number of junior high and high school students nationwide from the School Basic Survey of the Ministry of Education, Science and Technology (2017) as a standard population. Proportions with a 95% confidence interval (95% CI), as presented in the tables, were calculated using a weighting method based on one-stage cluster random sampling [24]. Two proportion Z-tests were conducted to compare the prevalence of each product between boys and girls. To observe the associations between the use of the three different types of products, we calculated the prevalence of combined use. Then, the proportions of combined use of products were calculated, which made the comparison of combined use easier. Moreover, the background of ever users of different products was compared in terms of gender, school grade, municipality size, having breakfast, and participating in club activities. IBM SPSS 25.0 was used for all data analyses.

Results

A total of 56% of 184 schools, including 48 of 98 junior high schools (response rate: 49%) and 55 of 86 high schools (response rate: 64%) took part in the survey. In total, 64,417 questionnaires were returned to the research office. After excluding the questionnaires that were blank, or had invalid/missing gender information or inconsistent responses, 64,152 questionnaires were analysed. The characteristics of the study participants are shown in Table 1. The mean age (standard deviation) of students in junior high school was 13.7 (1.0) years, and 16.7 (0.9) years for high school students. For the gender-ratio, 50.3% of junior high school students and 55.8% of high school students were boys.

Rates of cigarette and new tobacco-alternative product use

Broken down by product type and student gender, the age-adjusted rate of students who were ever/current/every day users of cigarettes, e-cigarettes, or HNB tobacco are shown in Table 2.

The rate of ever users of cigarettes (male/female/both) was 3.1% (95% CI: 3.0, 3.2)/2.1% (95% CI: 2.0, 2.2)/2.6% (95% CI: 2.5, 2.7) for junior high school students, and 6.9% (95% CI: 6.6, 7.2)/3.3% (95% CI: 2.0, 2.2)/5.1% (95% CI: 2.3, 2.9) for high school students. E-cigarette use was slightly lower than cigarette use, at 2.4% (95% CI: 2.3, 2.5)/1.7% (95% CI: 1.6, 1.8)/2.1% (95% CI: 2.0, 2.2) among junior high school students, and 4.9% (95% CI: 4.7, 5.1)/2.1% (95% CI: 2.1, 2.1)/3.5% (95% CI: 3.3, 3.7) among high school students. The rate of HNB tobacco users was relatively lower relative to other products, at 1.3% (95% CI: 1.3, 1.3)/0.9% (95% CI: 0.9, 0.9)/1.1% (95%

CI: 1.0, 1.2) among junior high school students, and 2.9% (95% CI: 2.8, 3.0)/1.4% (95% CI: 1.4, 1.4)/2.2% (95% CI: 2.0, 2.4) among high school students. Experience with of all products was significantly higher among adolescent boys than girls.

The rate of current use of the three products (male/female/both) was rare. For cigarettes, the rate was 0.7% (95% CI: 0.7, 0.7)/0.5% (95% CI: 0.5, 0.5)/0.6% (95% CI: 0.5, 0.7) among junior high school students, and 2.0% (95% CI: 1.9, 2.1)/0.9% (95% CI: 0.9, 0.9)/1.5% (95% CI: 1.4, 1.6) among high school students. For e-cigarettes, it was 0.8% (95% CI: 0.8, 0.8)/0.5% (95% CI: 0.5, 0.5)/0.7% (95% CI: 0.6, 0.8) for junior high school students, and 1.5% (95% CI: 1.4, 1.6)/0.5% (95% CI: 0.5, 0.5)/1.0% (95% CI: 0.9, 1.1) for high school students. For HNB tobacco, it was 0.6% (95% CI: 0.6, 0.6)/0.4% (95% CI: 0.3, 0.5)/0.5% (95% CI: 0.5, 0.5) for junior high school students, and 1.2% (95% CI: 1.1, 1.3)/0.6% (95% CI: 0.6, 0.6)/0.9%

(95% CI: 0.8, 1.0) for high school students. Among high school students, current use of three products were significantly higher among boys than girls. Significant difference was observed only in e-cigarette use among junior high school students.

The proportion of students who used the products every day was quite low, with the highest prevalence being that of cigarette use among high school students (male/female/both): 0.7% (95% CI: 0.6, 0.8)/0.2% (95% CI: 0.2, 0.2)/0.5% (95% CI: 0.4, 0.6). The age-adjusted rates for the new products were 0.1% or less.

As shown in Fig. 1, the use of combustible cigarettes was the most prevalent regardless of grade level. Ever use of e-cigarettes followed slightly below that of cigarettes, especially among the younger generation. A divergence was evident between ever use of HNB tobacco and that of the two other types. As for current use, the graphs of the three products overlapped each other in

the younger generation, but in grades 11 and 12, combustible cigarette use was significantly higher than the use of the other two products.

Combined use of any tobacco product

The age-adjusted rates of combined use of tobacco-related products were calculated (Additional File 2), including all possible combinations of combustible cigarettes, e-cigarettes, and HNB tobacco. Across the various patterns, the exclusive users of cigarettes and exclusive users of e-cigarettes were the largest groups.

Moreover, to make comparisons more understandable, the proportions of ever and current users of any product

are shown in Table 3. In terms of ever use, the proportion of exclusive users of combustible cigarettes was about 40% of users of any product in both junior high schools and high schools. Meanwhile, around 36% of users of any product used only e-cigarettes and/or HNB tobacco in junior high schools. Among high school users, around 25% of males and 32% of females ever used either one or both new alternative products. Furthermore, among junior high school students who currently used any product, exclusive e-cigarette users were the largest group among all patterns of use. In high school, exclusive combustible cigarette use, 30%, was dominant across the patterns; however, more than 30% of users currently used only new alternative products. It is worth mentioning that dual users who currently used both cigarettes and another type of products exceeded 30% in junior high school as well as in high school.

Additional File 3 shows the comparison of ever users of different products according to gender, school grade, municipality size, custom of having breakfast, and participation in club activities. Across the different users, the proportions of males were higher than those of females. However, gender differences were smaller when comparing e-cigarette users and HNB users with cigarette users. There were upward trends from lower to higher school grades in exclusive cigarette use and cigarette use combined with other products, but the trends were not clear among new alternative products users. Regarding lifestyle, adolescents who ever used new types of products showed acceptable habits. The percentage of individuals who had breakfast every day and participated in club activities was higher among new products users than among cigarette users.

Discussion

This study is the first in Japan to examine the prevalence of use of combustible cigarettes and new tobacco-alternative products among adolescents. At present, the rate of combustible cigarette use was the highest, followed by e-cigarettes and HNB tobacco use. The rates of use for all three products rose in tandem with increasing school grade. The prevalence of combustible cigarette use was much higher relative to alternative products among high school students, as these alternative products had been introduced into the market more recently. However, ever use of e-cigarettes became close to that of combustible cigarettes among the younger generations. Moreover, the current use of the three products was quite similar, suggesting that new tobacco-alternative products are becoming popular among young users.

Japan is included in the countries with the lowest smoking prevalence according to a World Health Organization report on the global tobacco epidemic

C combustible cigarette, EC electronic cigarette, HNB heat-not-burn tobacco

[27]. The present study focused on the use of new tobacco-alternative products among Japanese adolescents. However, even considering the increasing prevalence of these new products, the smoking rate has shown a downward trend compared with the respective proportions in time-series data. The current use of e-cigarettes of 0.7% in junior high schools and 1.0% in high schools in Japan is lower than that reported by the 2017 National Youth Tobacco Survey in the US (3.3% in middle school and 11.7% in high school) [28]. The law that regulates the sale of e-cigarettes containing nicotine in Japan might contribute to the lower use of these products. Another explanation may be that HNB tobacco exists as a substitute for e-cigarettes. Even though the current use of new products was low in our study, the use of e-cigarettes has been increasing in several countries. Continuous monitoring of e-cigarette use is thus indispensable.

Moreover, given the large population of e-cigarettes among any products users, it is of significance in assessing whether e-cigarettes used by Japanese adolescents contain nicotine or not. A previous study among Canadian high school students by Hamilton et al. showed that approximately 72% of those adolescents who were ever e-cigarettes users used non-nicotine e-cigarettes, while about 28% used nicotine e-cigarettes [29]. Similarly, a previous study indicated that in Japan, about 30% of ever users of new tobacco products used e-cigarettes containing nicotine [19]. The regulation of e-cigarettes in

Canada is quite similar to that in Japan, suggesting that the figures among the Japanese adolescents might be comparable to Hamilton's results. To note, Tabuchi et al. indicated that about 15% of those who were ever users had used e-cigarettes with unknown nicotine. Misinformation about nicotine content is concerning because nicotine might impact the developing brain of adolescents [29]. Future research should investigate these issues.

The prevalence of HNB tobacco use was lower than that of e-cigarette use; however, HNB tobacco use was still observed among adolescents. To our knowledge, there are no comparable reports about HNB tobacco use in other countries. Tabuchi et al. reported the current use as 3.6% in a 2017 internet survey targeting adults in Japan [23], which is comparable to our results. The prevalence of HNB tobacco use is more similar between adolescents and adults relative to the prevalence of combustible cigarette use. Awareness of and advertisements for HNB tobacco have increased in recent years [22]; a domestic Japanese newspaper reported in 2018 that the sales units of HNB tobacco exceeded 2 million for Glo, 5 million for IQOS, and 4 million for Ploom Tech, and indicated that the tobacco market was accelerating the shift to HNB tobacco [30]. The association between smoking rates and tobacco advertisements has been previously studied, and the increase in the use of e-cigarettes in Western countries has been attributed to media promotion [31]. The current momentum of HNB tobacco in Japan is expected to affect its future use rates. Its prevalence should be monitored, as there is substantial uncertainty regarding the health consequences of HNB tobacco [32, 33].

Gender differences in the prevalence rates were examined in the current study. Boys were more likely to use the tobacco-related products, which is consistent with the results previously reported by the WHO [27] and another study conducted in Japan [19, 23]. Previous research has indicated the importance of investigating gender difference in e-cigarette marketing strategies including innovations in product features (e.g., packaging and device design, appealing flavours), as they can influence gender difference in consumption. The authors also highlighted the necessity of examining gender differences in nicotine use by quantifying the amount of nicotine in the e-cigarettes being used by youth [34]. To our knowledge, no research to date has investigated gender difference in HNB consumption. Future research should examine the context in which gender differences in nicotine use might occur.

This study also examined the various patterns of use of the three products. As for adolescents' ever use and current use, exclusive cigarette use was dominant in all cases except for the exclusive use of e-cigarettes in

junior high school. A considerable proportion of any-product users were ever or current users of new alternative products only. Therefore, it is an important concern whether e-cigarette or HNB tobacco use can lead to established cigarette use in the future. A previous systematic review indicated that the use of e-cigarettes among adolescents was likely to cause subsequent cigarette smoking [16]. Although it is unclear, it is plausible that the use of HNB tobacco use has the same consequences. Future research is required to clarify this issue.

Another concern is 'dual use' which refers to the use of both combustible cigarette and at least one new tobacco products. Our results suggest that the proportion of dual users exceeded 30% in junior high school as well as in high school. Although the latest expert consensus indicated that e-cigarette use is much less harmful than smoking combustible cigarettes [17], dual use potentially denotes the addition of unknown harm from e-cigarettes or HNB tobacco to that of smoke from combustible cigarettes [17]. There is controversy over whether dual use of e-cigarettes can assist with smoking cessation or not. A recent systematic review has indicated that e-cigarettes are not likely to lead to smoking cessation [16]. Furthermore, to date, there has been no empirical evidence that has indicated that HNB tobacco products play a role in cessation. Future research should investigate these issues in order to clarify their implications for the overall health impact of e-cigarettes and HNB tobacco in Japan.

Moreover, our results indicated different characteristics in the healthy behaviours between those who were cigarette users and new products users. Previous studies have suggested that smoking is associated with an unhealthy lifestyle [35, 36]. Similarly, an association between health risk behaviour and e-cigarettes use has been reported [37]. However, to our knowledge, the relationship between new products and healthy behaviour among adolescents has not been sufficiently investigated. Dunbar et al. concluded that e-cigarettes use among adolescents is not necessarily associated with greater engagement in health behaviours compared to cigarette use [37]. With regard to HNB tobacco, Lee et al. indicated that physically active adolescents were more likely to use cigarettes as well as new products [38] and theorised that these findings were owing to peer influences from participating social activities. However, our results suggest that new products may be an entrance to smoking for a broad variety of adolescents, who are less likely to begin smoking if using combustible cigarettes alone. Previous studies indicated that new products might entice new groups of consumers with characteristics distinct from those of combustible cigarette smokers [39, 40]. Although the mechanism has not been

sufficiently clarified, it could be that new adolescent users may believe that the new products are 'safe' [41]. Future studies are needed to examine the association between health behaviours and the type of products used by adolescents. It is also significant to clarify whether young people who are at low-risk of becoming smokers are more attracted by new products.

A strength of the present study is that our large student sample represents the nationwide adolescent population of Japan. In addition, considering our specific tobacco regulation, Japan is a fertile market for tobacco industries. Our study is unique in that it reports on a novel product, HNB tobacco, which is not available in all countries. However, in this survey, the number of schools selected was relatively smaller than in past studies. Additionally, the response rates in junior high schools were low, leading to the use of age-adjusted rates in the tables. This study required strict ethical considerations due to the age groups taking part, which may have contributed to the low response rate. Although we devised questions about e-cigarettes and HNB tobacco, including the trade names of popular products, students still may not have recognised these products correctly and could have confused e-cigarettes and HNB tobacco. It is also difficult to confirm the validity of self-report answers. Continuous monitoring using the same standards and methods may be the only feasible option. Furthermore, this study entailed a cross-sectional analysis; therefore, the temporal relationship of how the smokers' practices changed as a consequence of the emergence of new tobacco products could not be clarified. Future research should address these limitations.

Conclusions

According to this nationwide population survey, the prevalence of new tobacco-related products is just below the use of combustible tobacco among Japanese adolescents. Dual use is common, and e-cigarettes or HNB tobacco use represent a considerable proportion of the tobacco-related products used by youth. Findings from background comparison suggest that new tobacco-related products might lure a broader population into smoking. The longitudinal impact of these new products remains unclear; thus, continuous monitoring and further research are necessary to provide guidance for the implementation of enhanced public measures against smoking and the use of new tobacco-related products.

Authors' contributions

YO, SH, and YoK designed the study and devised the study protocols. Ol, YuO, MJ, and HY did the literature review and helped summarise previous research studies. HK, AK, MF, and AI carried out the statistical analyses. YK wrote the first draft of the manuscript. All authors have read and approved the manuscript.

Funding

This study was supported by a grant for Comprehensive Research on Lifestyle-Related Diseases including Cardiovascular Diseases and Diabetes Mellitus by the Ministry of Health and Welfare Health Science Research Fund in Japan (grant no. 29060801). The funding body did not have any role in the design of the study; collection, analysis, and interpretation of data; or in writing the manuscript.

Availability of data and materials

The datasets used in the current study are available from the corresponding author on reasonable request.

Ethics approval and consent to participate

The participants were older than 12 years of age. Before the survey, the school principals provided participants' parents with the details of the survey. The parents were advised that they were allowed to refuse participation if they were reluctant to allow their children to take part in the survey. In other words, the parents were given the opportunity to opt their children out of the survey if they were not comfortable with them participating in the survey. The students whose parents refused permission for the survey were not included. This survey and opt out parental consent procedure were approved by the Ethics Review Committee of Tottori University Faculty of Medicine (reference no. 17A078).

Consent for publication

Abstract: The impact of heated-tobacco-products (HTPs) and electronic cigarettes (e-cigarettes) on youth is a controversial public health issue, as it is unknown whether alternative products result in more youth using such products or smoking. In Japan, e-cigarettes with nicotine are prohibited, but e-cigarettes without nicotine are available. HTPs are marketed as tobacco products. Within this unique context, we aimed to compare any conventional cigarette smokers (including those who also used alternative products) with exclusive users of alternative products and examine factors relating to their use in Japan. In 2017, 22,275 students in grades 7–9 (age 12–15) and 42,142 in grades 10–12 (age 15–18) nationwide were surveyed. Overall, 1.8% were current users of any of the three products over the last month. Multivariable analysis revealed that risk factors for alternative product use were the same as those for cigarette use. Among all users, exclusive new product users were more likely to participate in club activities and intend to continue to higher education; any conventional cigarette users (including those who also used alternative products) were more likely to be exposed to secondhand smoke at home and to drink alcohol. Reducing adult smoking and disseminating health education remain relevant as strategies for preventing adolescents' future tobacco use.

Keywords: cigarette smoking; e-cigarettes; tobacco use; adolescents; smoking; heat-not-burn tobacco; heated tobacco product; Japan; tobacco control policies; WHO Framework Convention on Tobacco Control (FCTC); noncombustible tobacco/nicotine products; harm reduction

1. Introduction

Tobacco control presents a crucial public health challenge worldwide. A wide range of health problems are attributable to tobacco use, including not only non-communicable diseases, but also perinatal problems and impaired physical and mental development [1]. In fact, premature death due to tobacco use is more preventable than deaths caused by any other drugs [2]. Moreover, the younger people are when they start smoking, the more likely they are to continue smoking [3], making them susceptible to well established smoking-related diseases including cancer, cardiovascular disease and respiratory diseases. The World Health Organization (WHO) has taken the initiative in promoting

global tobacco control. Since 2008, the WHO Framework Convention on Tobacco Control (FCTC) has been endorsing practical and cost-effective ways to reduce tobacco demand worldwide using the acronym MPOWER, standing for Monitor (use and prevention), Protect (people from smoke), Offer (help in quitting), Warn (about dangers), Enforce (bans on advertising, promotions and sponsorship) and Raise (taxes on tobacco products).

Smoking cigarettes comprises one of the biggest risk factors for death and disease in Japan, as indicated by a study that estimated the contribution of several risk factors to disability-adjusted life years (DALYs) in Japan from the findings of the Global Burden of Disease (GBD) 2010 project [4]. The Institute for Health Metrics and Evaluation (IHME), a research center dedicating to measuring health problems affecting populations worldwide, reported that cigarette smoking was the dominant risk for death and disability combined in Japan for all years from 2007 through 2017 [5]. Due to the seriousness of the problems associated with smoking, the Ministry of Health, Labor, and Welfare (MHLW) has been tackling issues of tobacco control. In 2000, the national health promotion campaign ‘Healthy Japan 21’ was launched, which included dissemination of knowledge about the health effects of smoking, encouraging youth to stop smoking, calling for the separation of smoking areas and launching a smoking cessation program. In 2003, the Health Promotion Law mandated the management of public facilities to prevent public exposure to secondhand smoke. The law promoted the creation of smoke-free spaces and smoke-free regulation by local authorities. Since 2013, Healthy Japan 21 (second term) has been in effect. The tobacco control measure included four main objectives: (1) decrease the smoking rate for adults from 19.5% in 2010 to 12% in 11 years; (2) eliminate smoking among adolescents and young adults; (3) stop women from smoking during pregnancy; and (4) decrease the occurrence of secondhand smoke and eliminate smoke exposure in all administrative and medical institutions. These political measures added to the already-existing nationwide tobacco controls and smoking prevalence has been decreasing for both adults and adolescents over several decades [6], yet tobacco regulation in Japan still has not met all the FCTC’s recommendations [7].

Meanwhile, new types of alternative nicotine delivery products such as e-cigarettes and various heated tobacco products (HTPs, also called heat-not-burn tobacco products) have emerged in the tobacco market. The e-cigarettes market has rapidly expanded according to a report from the WHO [8]. This matches the findings of a separate study that reported on the prevalence of these new products in several parts of the world [9]. Additionally, the U.S. Center for Disease Control recently reported the trial of e-cigarettes (people ‘trying’ the product) exceeds that of conventional cigarettes in the US [10]. A study from Japan also indicated an increase in the trial of new alternative products [11].

Recently, the U.S. Food and Drug Administration (FDA) permitted the sale of IQOS—an HTP that generates a nicotine aerosol compound—with restrictions on how it can be marketed [12]. While tobacco industries advertise that the tobacco used in HTPs is cleaner, public health experts are discussing the challenges and opportunities created by these new products.

Some of the challenges involve how to categorize and regulate the products, and regulation varies across different countries. Notably, Japan is unique in that national law prohibits selling e-cigarettes containing nicotine, but HTPs are sold as legal tobacco products. In terms of regulation, e-cigarettes without nicotine are available to everyone in Japan, but the purchase and use of HTPs are prohibited among people aged under twenty years old. The age requirement for cigarettes is also twenty years old.

There is a significant and controversial public health concern as to whether the novel products attract susceptible young non-users to initiate use of e-cigarettes or HTPs and then go on to smoking [13]. Previous studies have shown that some youth who are otherwise at low risk for smoking cigarettes, and therefore at low risk for using nicotine, are attracted to using e-cigarettes [14] and later begin to smoke conventional cigarettes [15]. Moreover, to consider the overall population impact of HTPs, more evidence is necessary to inform discussion of the likelihood of adolescents who are not tobacco users or who are former tobacco users adopting the use of nicotine with the new products [16]. On the other hand, if the novel products are confined to youth who are already likely to become smokers,

or who use them to stop smoking, they may represent an opportunity to reduce the number of adolescents who are harmed by the effects of combustible cigarettes [17].

The purpose of this study was to compare the background of conventional cigarette smokers with exclusive users of alternative products among young people aged 12 to 18 to highlight the difference between the groups.

2. Materials and Methods

2.1. Study Population

In 2017, Japan had 10,325 registered junior high schools and 4907 registered senior high schools in a total of 47 prefectures. For our study, schools were chosen for students to participate in a lifestyle survey of adolescents. The participating schools were selected using a cross-sectional random sample method with single-stage cluster sampling [18], wherein a school was considered a cluster unit. The sampling method included dividing Japan into regional blocks and randomly selecting schools from each block. The advantage of this methodology is the minimization of sampling bias [18]. Using the national school directory, junior high schools and senior high schools throughout Japan were randomly extracted, and the survey was administered to all students in these schools. Thereby, 98 of Japan's junior high schools from 44 prefectures and 86 of the senior high schools from 42 prefectures were sampled; therefore, the selection rates were 0.95% and 1.75% of all schools, respectively. Private schools comprised 8.2% of the junior high schools and 19.8% of the senior high schools in the study. The surveys were administered from December 2017 through February 2018.

2.2. Data Collection

We approached the principal of each school for cooperation and sent the survey forms to the schools. The principals arranged for class teachers to distribute the forms to the students. The teachers explained to the students that participation was voluntary and that they should answer honestly. The students were given anonymous questionnaires and envelopes, which were completed and sealed by the students, collected by their teachers, and then returned to the research office with the seals intact.

2.3. Measures

The questionnaire included information about basic demographic data (sex, school grade, type of school); use of cigarettes, e-cigarettes and HTPs; exposure to secondhand smoke and understanding of the harmful effects of smoking; lifestyle behaviors and intentions regarding future education; and alcohol use. The list of the questions was provided in Supplementary file 1.

2.4. Use of Cigarettes, e-Cigarettes and Heated Tobacco Products

2.4.1. Discrimination of the Three Products

The three products were described in detail to ensure students were able to distinguish between them. Since we focused on investigating alternative products, we explained that a conventional cigarette is considered, 'a cigarette made from rolled paper and tobacco and smoked with fire'. Due to the number of e-cigarettes currently for sale, we used the names of the most popular brands in the survey; for example, e-cigarettes included フレヴォ (FLEVO), エミリ (EMILI), ビタフル (VITAFUL) and ビタシグ (VITASIG). HTPs were also explained using product names to avoid any confusion; for example, heat-not-burn tobacco included アイコス (IQOS), プルームテック (Ploom Tech) and グロー (glo).

2.4.2. Frequency of Use

To assess the frequency of conventional cigarette use, with the explanation of products above, we used two questions: 'Have you ever smoked a conventional cigarette, including even a single puff?'

and ‘How many days have you smoked conventional cigarettes in the previous 30 days?’ Similar questions were used to determine the frequency of use of alternative products. For the experience question, ‘No, I have not’ or ‘Yes, I have’ were response options. To assess frequency of use, seven options were given: ‘0 days,’ ‘1–2 days,’ ‘3–5 days,’ ‘6–9 days,’ ‘10–19 days,’ ‘20–29 days,’ or ‘every day’.

‘Experience’ of cigarette/e-cigarette/HTP use was defined as smoking/using even once in the past; ‘current’ use of cigarettes/e-cigarettes/HTPs was defined as smoking/using at least once in the past 30 days. ‘Current use’ is more relevant to actual smoking behavior and is commonly used as an indicator of adolescent smoking. Furthermore, previous studies suggest that even minimal use of cigarettes leads to a significantly higher risk of becoming a chronic smoker [19,20]. Therefore, we determined ‘current use’ as a feasible outcome to use for analysis.

Additionally, in our analyses, we used ‘exclusive-use’ categories, meaning the exclusive use of a particular type of product. For instance, if we described ‘exclusive alternative product use’, the group included participants who currently used either e-cigarettes or HTPs but did not use conventional cigarettes. ‘Non-current user’ was defined as those who currently used neither cigarettes, e-cigarettes, nor HTPs. ‘Any conventional cigarette smokers’ were defined as those who currently smoke conventional tobacco cigarettes, including those who currently smoke conventional tobacco cigarettes exclusively and those who currently use conventional tobacco products plus HTP and/or e-cigarettes.

2.5. Lifestyle Behaviors and Intentions towards Future Education

In Japan, many students participate in after-school clubs. Some students engage in sports clubs at school, such as baseball, tennis or basketball; others choose cultural clubs, such as brass band, tea ceremony and flower arrangement. The questions asked about how often students participated in such ‘after school club’ activities as well as how often they had breakfast and their plans for the future. For analysis, answers indicating they eat breakfast ‘every day’ were categorized into ‘Yes’; answers of ‘sometimes’ or ‘seldom’ were categorized as ‘No.’ Regarding their plans for the future, students selected one out of seven options: ‘vocational school,’ ‘junior college,’ ‘college,’ ‘postgraduate school,’ ‘taking a job after graduating the current school,’ and ‘not decided yet’. We categorized those who selected ‘college’ or ‘postgraduate school’ into the ‘college or more’ group.

2.6. Exposure to Secondhand Smoke and Understanding the Harmful Effects of Smoking

For the survey questions about smoking exposure, we did not discriminate between the three products and described smoke as from ‘tobacco.’ In addition, ‘to smoke’ was the same as ‘to use tobacco.’ Students were asked about if and how often they were exposed to secondhand smoke at home. Participants who indicated they had been exposed at least once in the preceding seven days were categorized as ‘exposed.’ Survey questions were also used to determine how much students understood about the health risks of smoking. We categorized those who selected ‘I think that smoking is harmful’ into ‘Yes’ for understanding the harmful effects of smoking; all other responses were categorized as ‘No.’ Likewise, understanding the harm associated with secondhand smoking was evaluated; participants who selected ‘I think it is harmful’ were categorized into the ‘Yes’ group for understanding and all other responses were considered ‘No.’

2.7. Alcohol Use

We assessed how many days participants had engaged in drinking alcohol in the previous 30 days and the frequency of binge drinking. We consider drinking ‘a lot’ to be ‘five or more’ drinks of an ordinary can (350 mL) for beer and sweet cider. We defined a ‘current drinker’ as a student who had used alcohol on more than one or two days in the previous month and ‘binge drinkers’ as those who used alcohol including more than five cans of beer or sour at least once in a month. Specifically, having multiple drinks ‘once or twice in a month’, ‘once or twice in a week’, or ‘more than three times in a week’ were categorized as ‘yes’ for ‘binge drinking’ for the purpose of analysis.

2.8. Data Analysis

First, a descriptive analysis of the baseline characteristics of the study participants was performed including their grade levels (junior or senior high school), the overall prevalence of use of any products, and factors known to be associated with smoking. Second, Chi-squared tests were used to examine differences in each factor between any conventional cigarette smokers and non-current users. The Mantel-Haenszel test was used to compare the trends of the proportion of use in each school grade. Similarly, exclusive users of alternative products were compared with non-current users and then with any conventional cigarette smokers (including dual users and multiple users). For the latter comparison, we were interested in whether those youth who currently used only alternative products differed from those who currently smoked conventional cigarettes. Furthermore, in the comparison, we conducted the statistical tests for each of the 11 variables; hence, the Bonferroni correction was used to adjust the cut-off of *p*-values for significance due to multiplicity. Third, a multivariable logistic regression analysis was used to investigate the relationship between the use of cigarettes and several factors from the questionnaire. The adjusted odds ratio (OR) was calculated for each factor and its 95% confidence interval (95% CI) for cigarette use. Likewise, another logistic regression analysis was done with alternative product use. Finally, among any product users, the risk of alternative product use was compared with any conventional cigarette users in a third logistic regression model. Before the logistic regression analysis, the researchers discussed the relevance of all of the variables in this study and selected, by consensus, those most appropriate for inclusion in the models. Descriptive analysis and univariate analysis were performed using SPSS 25.0 (IBM Corp, New York, NY, USA). R i386 3.5.2 (R Foundation for Statistical Computing, Vienna, Austria) was used to conduct multivariable logistic regression analyses. Missing data were excluded from the analysis. We also conduct a supplementary analysis to compare exclusive cigarette users and exclusive alternative products (APs) users.

2.9. Ethical Statement

According to the Ethical Guidelines for Epidemiological Studies jointly announced by the Ministry of Health, Labor and Welfare and the Ministry of Education, Culture, Sports, Science and Technology of Japan, personal information is defined as follows: information of a living individual and the name, birthday and other descriptions included in that information that can be used to identify a specific individual. The questionnaire in our survey did not include any such information in consideration of identity protection and safeguarding privacy. This survey was reviewed and approved by the Ethics Review Committee of Tottori University School of Medicine when we conducted the survey (reference no. 17A078).

3. Results

The flow and results of the data collection are described in Figure 1. A total of 184 schools (98 junior high, 86 high school) were invited and 56.0% (103), including 49.0% of junior highs (48) and 64.0% of high schools (55), agreed to participate. The response rate of all students in the participating schools was 90.5% (64,152 of 70,927) for fully completed surveys, including 84.0% (22,215 of 26,604) from the junior highs and 94.6% (41,937 of 44,323) from the high schools.

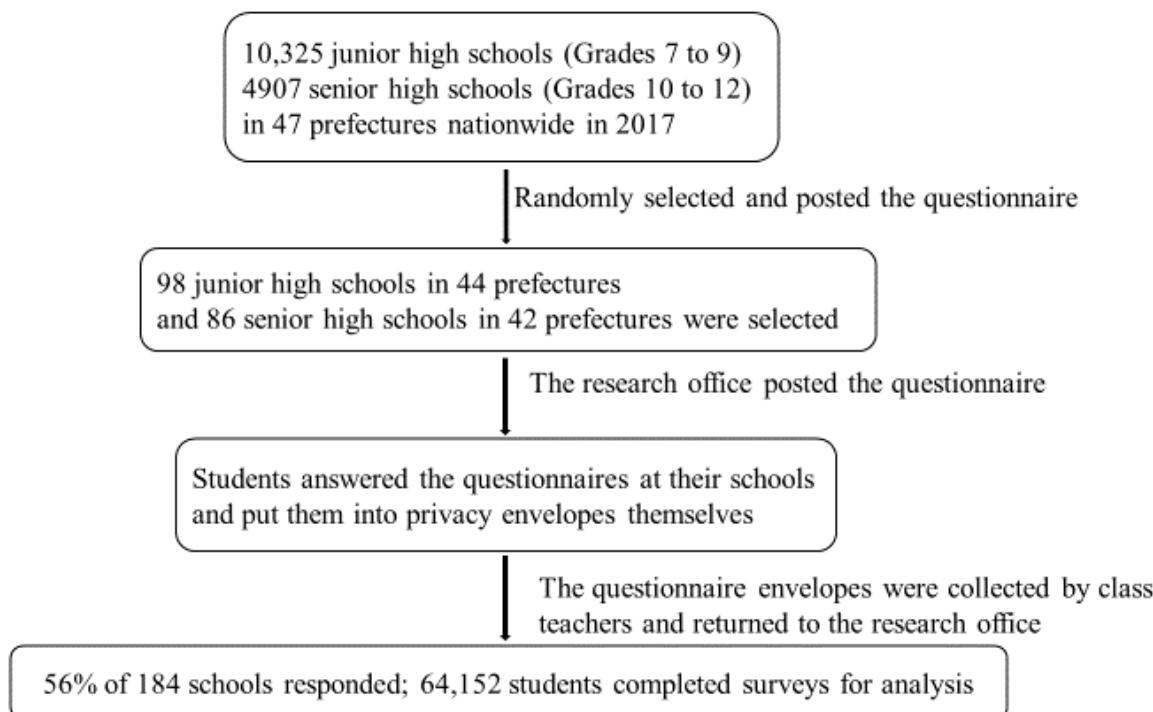

Figure 1. Flowchart of data collection.

3.1. Participant Characteristics

Table 1 shows the baseline characteristics of the study participants. In terms of lifestyles, the proportions of participants who indicated mostly healthy lifestyle habits was higher in junior high school students than senior high school students; however, more senior high students than junior high students intended to go to college or university. Regarding students who had used any products (tobacco or alternative): 4.1% in junior high and 7.3% in senior high school had at some time in their lives; 1.1% in junior high and 2.2% in senior high had at least once within the 30 days preceding the survey. The percentage of students who reported drinking alcohol at least once in the past month was 2.9% in junior high and 7.0% in senior high school. While binge drinking was quite rare in junior high school (0.6%), 1.9% of senior high school students responded that they had five or more cans of alcoholic beverages in one bout of drinking at least once in the preceding month.

To clarify the relationships between the use of the three different products, we created a Venn diagram (Figure 2) to show the total number of respondents who were ‘currently’ using each product. Overall, 1.8% ($n = 1183$) students reported using any product at least once in the prior month. Just over 40% were currently using more than one product; 200 students (17% of all current users) were ‘currently’ using all three products. Thirty percent of those using any product were exclusive e-cigarette or exclusive HTPs users, although compared to cigarettes and e-cigarettes, the number of respondents who only used HTPs was small. Thus, HTPs were most commonly used along with other products.

Table 1. Baseline characteristics of the study participants.

	Junior High School (Grades 7 to 9)		Senior High School (Grades 10 to 12)

^a People who drink more than five cans of beer or sour at least once in a month.

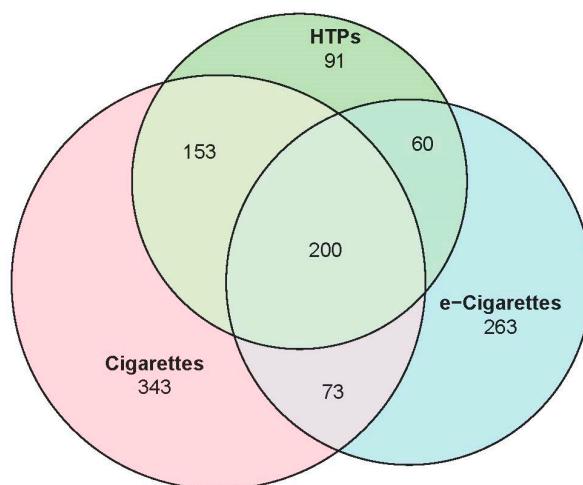

Figure 2. The number of current users of any products, Grade 7–12, male and female. In total, *n* = 1183 (1.8%; *N* = 64,152) The overlap areas represent those who used both or all; the non-overlap area indicates the total number of students who used each product exclusively. Abbreviations: HTPs = heated-tobacco-products.

3.2. Comparison among Any Conventional Cigarette Users, Exclusive Alternative Products Users and Non-Users

Table 2 compares the proportion of respondents according to sociodemographic, lifestyle and other variables among three groups: people who do not currently use any products, any conventional cigarette users and exclusive AP users (the numbers vary slightly from table to table due to missing data). By Bonferroni correction, we adjusted the cut-off for significance as $p < 0.0045$. Overall, more males than females were users of any type of product; however, there was no significant difference between genders among users in terms of which type of product they used (cigarettes or APs). Regarding school grade, the trend in the proportions of the three groups were significantly different. For other variables—having breakfast every day, engaging in club activities, understanding the health effects of smoking, exposure to secondhand smoke and alcohol use—the proportions of students

were significantly different between non-users and the other two groups. Moreover, the statistical tests showed that there were significant differences in those variables between AP users and any conventional cigarette users, except for that of having breakfast every day, future education intention and understanding of harmful effects of smoking.

Table 2. Cross-comparison of three group: non-users with any conventional cigarette smokers and exclusive alternative-product use in youth, including demographics, lifestyles, school life and drinking habits.

Variables	1. People Who Say They Do Not Use Any Products		2. Any Conventional Cigarette Users		3. Exclusive AP Users		1 vs. 2	1 vs. 3	2 vs. 3
	n	(%)	n	(%)	n	(%)	p-Value	p-Value	p-Value

Abbreviations: APs = alternative products. Missing data were excluded in each analysis. p-Values are based on Chi-squared test. ^a Mantel-Haenszel test for trend is used in the variable. ^b People who drink more than five cans of beer or cider at least once in a month.

3.3. The Association between Selected Factors and Any Conventional Cigarette Smoking or Exclusive Alternative Products Use

The results of a logistic regression analysis examining the risk factors for any conventional cigarette smokers compared with non-users are shown in Table 3. All factors—sex, school grade, understanding that smoking is harmful, having breakfast every day, participating in club activities, intending to go to college or a higher education course and present alcohol drinking—were significantly associated with any conventional cigarette smoking after mutual adjustment. Similarly, an analysis comparing lifestyle variables of exclusive AP users with those of non-users revealed that seven out of eight variables were significantly associated with AP use (Table 4). Although the students engaging in club activities were less likely to smoke cigarettes (OR 0.64, 95% CI 0.54, 0.76), the variable was not a significant preventive factor for exclusive AP use (OR 1.17, 95% CI 0.94, 1.48).

Table 3. Results of logistic regression: association between selected factors and any conventional cigarette smokers ($n = 63,738$).

Variables	OR	95% CI		<i>p</i> -Value
Sex

* This variable was modeled as a continuous variable. Abbreviations: OR = odds ratio, 95% CI = 95% confidence interval.

3.4. The Risk of Exclusive Alternative Product Use Compared with Any Conventional Cigarette Smoking among Any Product Users

Table 5 shows the result of logistic regression analysis which examined risk-associated lifestyle variables for exclusive AP users compared with those for any conventional cigarette smokers among users of any products. The results show that AP users were less likely to be higher school grade, more likely to participate in club activities (OR 1.61, 95% CI 1.22, 2.12), less likely to be exposed to secondhand smoking at home (OR 0.68, 95% CI 0.52, 0.90) and less likely to be current alcohol drinkers (OR 0.27, 95% CI 0.21, 0.35). In addition, there was a borderline significant association of exclusive AP users with ‘intention to pursue higher education’ (OR 1.35, 95% CI 0.99, 1.83).

Table 5. The risk of exclusive alternative product use compared with any conventional cigarette use among any product users ($n = 1183$).

Variables	OR	95% CI		p-Value
Sex				
Female	1.02	0.75	to	1.37
Male (reference)	1.00			
School grade *	0.96	0.93	to	0.99
Understand that smoking is harmful				
Yes	1.18	0.89	to	1.57
No (reference)	1.00			
Having breakfast everyday				
Everyday	1.03	0.78	to	1.35
Sometimes, seldom (reference)	1.00			
Participating in club activities				
Yes	1.61	1.22	to	2.12
No (reference)	1.00			
Intending to pursue higher education				
College or postgraduate school	1.35	0.99	to	1.83
Others (reference)	1.00			
Secondhand smoking at home				
At least once in the preceding 7 days	0.68	0.52	to	0.90
None in the preceding 7 days (reference)	1.00			
Currently drinking alcohol				
At least once in the previous month	0.27	0.21	to	0.35
None in the previous month (reference)	1.00			<0.01

* This variable was modeled as a continuous variable. Abbreviations: OR = Odds ratio, 95% CI = 95% confidence interval. An odds ratio of greater than one indicates that exclusive alternative product users had higher odds of the factor than any conventional cigarette users.

The results of an additional logistic regression analysis were the same as for the groups compared above regarding club activities and alcohol use when comparing exclusive combustible cigarette smoking (conventional cigarettes only) to exclusive AP use, (Supplementary file 2).

4. Discussion

The prevalence of any current product use in this Japanese sample, (1.1% of junior high school and 2.2% of senior high school) in 2017, was much lower than has been shown for students in the U.S. (7.2% of middle school and 27.1% of high school [10]) and UK (5% of 11–15 years old who smoke cigarettes at least once in a week and 6% of young people estimated as current e-cigarette users [21]). The prevalence of current cigarette smoking has continued to decline from 2000 to 2014; 9.4/5.6% (boys/girls) to 1.3/0.6% in junior high school students and 29.9/13.1% to 3.5/1.5% in high school students [6]. Our data indicates the continuous downward trends. The relationship between the three products illustrates a significant minority (30%) of those who used any products were exclusive AP users. The prevalence of smoking was much lower than alcohol use among Japanese adolescents.

We were interested in whether the factors related to exclusive use of APs are different from those of any conventional cigarette smokers. To examine this question, we compared three groups: people who do not currently use any products, current AP-exclusive users and any current conventional cigarette smokers. There were significant differences between non-users and exclusive APs users or any cigarette smokers (in all variables studied. In addition, comparing exclusive APs users and any cigarette smokers), four of the eight factors were statistically significant. These results suggest that participant characteristics may be different between non-users and any product users and some of these differed also between AP users and cigarette smokers. Across each variable, the results for AP users fell between the variable results for non-users and those for cigarette users.

The results of logistic regression analysis showed that known factors were significantly associated with any conventional cigarette smoking and APs use even after mutual adjustment. When exploring the difference between exclusive APs users and any conventional cigarette smokers—including those who also use HTPs or e-cigarettes, the conventional cigarette users were more likely to be exposed to secondhand smoke and drinking at home than AP-only users. Moreover, we found that there were differences in participating in club activities between the two groups; intention to pursue higher education also showed borderline significance. These results may suggest different factors—including social circumstances such as parental support, family income, or personal characteristics—may exist between exclusive AP users and those smoking cigarettes with or without the use of other products. Broadly consistent results were found when comparing exclusive cigarette smokers with exclusive AP users. The implications of this are unclear as those exclusively using APs may have previously smoked conventional cigarettes and stopped or may go on to smoke conventional cigarettes or remain exclusive AP users. This requires further research.

Our analytical strategy followed that of a previous study by Hanewinkel et al. that investigated risk factors associated with the use of e-cigarettes in a cohort study among German adolescents [22]. They compared the effect of each risk factor across e-cigarette, conventional cigarette and dual product use. The study implied the possibility that e-cigarettes attract a broader range of adolescents compared to conventional cigarettes. Several results of the present cross-sectional study were consistent with the Hanewinkel's study. Gender and parent smoking showed significant effects on the use of both e-cigarettes and cigarettes. In addition, in their study, the relationship with a future academic career varied between e-cigarettes users and conventional cigarette users. Regarding HTPs, the findings of Wu et al.'s study indicate that relatively well-educated people tend to use HTPs [23]. These findings support our borderline significance in the association between education and exclusive APs use. Moreover, the previous cross-sectional study by Wills et al. [24] tried to determine whether established risk factors for smoking discriminate user categories by testing how e-cigarette users differed on a range of variables including social-cognitive factors, problem behavior risk factors and collateral substance use. Their findings showed parental factors, academic achievement, behavioral self-control, smoking expectancies, alcohol use, and heavy drinking significantly varied across non-users, e-cigarette exclusive users and dual users. Thus, their results also support our findings.

On the other hand, East et al. explained the former issue in a more nuanced way [25]. In their longitudinal study, they indicated that e-cigarette use was associated with cigarette use and vice versa. Certain psychological processes ('common liabilities') are used to explain the relationship of two. Specifically, curiosity, rebelliousness, and sensation-seeking were indicated as the psychological factors affecting product use. These psychological mechanisms also influence alcohol use. Hence, the strong association between any conventional cigarette smokers and alcohol use may be explained by these factors. In addition, the authors discussed several important differences to consider. In the UK, e-cigarettes are more accessible and convenient for young people compared to combustible cigarettes. Novel devices, the variety of flavors and the reduced risks of the new products have been demonstrated to be attractive to youth. Hair et al. also indicated that HTPs attract youth by the novelty [26]. Thus, several reports clarify that APs often appeal to those who are not smokers, but it remains unclear whether people in this group would have gone on to smoking if APs had not been on the market.

Furthermore, it is necessary to further investigate the exclusive conventional cigarette use and the use of conventional cigarettes plus APs and their association with secondhand smoke at home, as there may be an implication that APs users intentionally avoid being exposed to and exposing others to secondhand smoke. On the other hand, it is possible that exclusive conventional cigarette users and those that use them along with APs may be high-risk groups who do not care about the negative consequences of exposure to multiple substances.

Our findings suggest several implications for future tobacco control. From the consistent results related to secondhand smoking at home, the smoking status of any family members significantly affects any type of product use among younger populations, suggesting that public health measures are needed to decrease adult smoking in order to prevent smoking among younger people and vice versa. Although the systematic reviews showed inconsistent results about the effect of e-cigarettes on smoking cessation, the latest PHE reports deduced that a considerable number of smokers quit after e-cigarettes were introduced in the UK [27]. Similarly, Lee et al. estimated that introducing a reduced-risk product into Japan substantially reduced smoking-related deaths [28]; further independent research would be useful in this area [29]. It is also worth mentioning that there is a gap in the implementation of MPOWER between Japan and the UK. As mentioned above, the regulation of tobacco, including APs, in Japan is unique and is behind global standards.

Furthermore, understanding of the harmful effects of smoking showed a protective effect against any type of product use. This finding implies that health education about smoking is an indispensable tobacco control measure. Adolescent trends in tobacco use have been decreasing and are at their lowest level seen in many years. We must maintain this trend of fewer adolescents using tobacco and keep up the use of this essential strategy—health education—with younger generations. It is also important to continue to monitor the trend of tobacco use including the novel alternative products in order to evaluate our current public health measures for tobacco control.

Our study includes several strengths. The data were collected from a nationwide large sample survey. This methodology enabled us to minimize sampling bias [18]. Hence, the result of this study can potentially be generalizable nationwide for Japanese adolescents. Although the proportion of current users of any of the three products was relatively small, the large sample size enabled us to select ‘current use of the products’ as the outcome for analysis, in contrast to previous studies that selected ‘having ever used’ as an outcome. However, it should be noted that our definition of ‘current use’ (in line with other research) is ‘any use within the last 30 days’ so it picks up a range of users including some who may only be using intermittently. In addition, Japan has a unique regulatory environment. E-cigarettes without nicotine are available, but HTP products have also been widely promoted since 2014. This means that the situation around cigarettes and APs differ from other countries. Given Japan’s unique situation, this study aimed to clarify the prevalence and risk factors of AP use among adolescents in Japan.

However, there are several limitations to the present study. First, the schools’ response rates were not as high as we expected, though the student-response rate was preserved, as it was high among those schools that did participate. Despite the efforts of the research team, ethical concerns and inconvenience due to the need for strict explanations may have caused the lower rate of cooperation among schools. However, the higher ethical concern was required to meet the criteria for recent ethical approval. Second, the fact that class teachers distributed the forms may have impacted the results. As stated above, to address students’ concerns about privacy, student questionnaires were anonymous, and the students put them into private envelopes themselves. In addition, the explanatory document given to the class teachers explained that they must ensure students’ privacy. Third, the consequences of multiple testing must be considered. As shown in Table 2, many hypotheses tests were performed, increasing the possibility of spuriously significant results. However, most of the significant results were lower than the adjusted p values—less than 0.004—and we factored this into our interpretation of the results. Fourth, the survey questions for the smoking environment only asked about ‘tobacco’. This may have caused confusion for students answering questions as to if their parents used

APs or about their exposure to aerosol from APs. Finally, as stated above, we should be cautious in interpreting the presented relationships identified in this cross-sectional analysis as causal. In addition, it is possible that confounding causes spurious associations, either through residual confounding of recorded variables, or variables that were not recorded at all. Therefore, present results are limited with regard to investigating what causes the relationship and accurate effect size. However, by using available variables, we tried to explore the factors which were associated with cigarettes and APs and compare them to clarify the relationships. As mentioned above, similar results from previous literature can support our findings.

5. Conclusions

In conclusion, the study results show that currently there is a very low prevalence of smoking and/or alternative products among youth in Japan aged 12 to 18 years. We found that the characteristics of alternative product users and any conventional cigarette smokers, differ from non-users, and there were some differences between exclusive AP users and any conventional cigarette smokers. Conventional factors consistently related to alternative products' use indicate that reducing adult smoking and disseminating health education among adolescents remain important strategies for future tobacco control among adolescents. The priority must be to reduce tobacco use and nicotine addiction even further. To achieve the obvious goal, further research is necessary into the use of alternative products. Policymakers need to consider the updated measures on restrictions on labeling, advertising, sales to minors, pricing and taxation so that the Japanese national public health agenda goals can be achieved.

ABSTRACT

Objectives: Low sleep quality in adolescents is an important public health concern, as it relates to both their current and future physical and mental health. Furthermore, subjective happiness is also often regarded as a major life goal. Although Japan is an economically powerful country, the reported levels of subjective happiness among Japanese adolescents is low. Thus, this study aims to examine the relationship between subjective happiness and sleep problems in Japanese adolescents.

Methods: We conducted a nationally representative cross-sectional study of adolescents enrolled in junior and senior high schools in Japan. We used a questionnaire to determine the prevalence of sleep problems (eg, insomnia, short sleep duration (SSD) and poor sleep quality) and to evaluate the participants' reported levels of subjective happiness. Multivariable logistic regression analyses were used to examine the associations between subjective happiness and sleep problems. Adjusted variables were basic demographic characteristics (eg, gender and school grade), lifestyle behaviors, and mental health status.

Results: Data from 64,329 students were analyzed (age range 12–18 years, mean age 15.7 years, 53.9% male). The results indicated that reported levels of subjective happiness were strongly associated with the prevalence of sleep problems. Linear relationships can be observed between sleep problems and subjective happiness scores. The multivariable logistic regression analysis showed that dose-response association of subjective happiness score was observed with all three sleep problems.

Conclusions: Due to these findings, we recommend that policy makers and school officials educate adolescents on the importance of both subjective happiness and good sleep hygiene.

1. Introduction

Sleep problems in adolescents are recognized internationally as a major health concern. Previous studies have reported that 11%–30% of adolescents suffer from sleep problems [1,2]. According to a study performed in 2004, the prevalence of Japanese adolescents

(junior and senior high school students) who sleep for less than 6 h at night is 28.7% for male students and 32.6% for female students [3]. In particular, insomnia is common among Japanese adolescents, with a prevalence rate of 23.5%, as reported in a nationwide study performed in 2006 [4]. Sleep problems (eg, insomnia and short sleep duration) in adolescents have been associated with physical health problems such as obesity, insulin resistance, and a higher risk for cardiovascular abnormalities [5–7]. Sleep problems have also been shown to negatively impact adolescents' mental health, increasing the risk of several mental health concerns including

E-mail address: nusmpublichealth@gmail.com (Y. Kaneita).

anxiety, depression, suicidal behavior, and attention disorders [8–10]. Furthermore, poor well-being [11] and emotional dysregulation [12] were associated with sleep problems as well. Thus, sleep problems are one of the important public health problems related to adolescents' present and future physical and mental health.

Subjective happiness has received increasing attention from academics and policymakers around the world. Furthermore, subjective happiness is often regarded as a major life goal [13]. "Happiness" broadly refers to a general assessment of well-being and is a low arousal positive emotion [14,15]. Subjective happiness assesses the levels of positive and negative influences on one's well-being over a specific brief period of time [14]. The Organization for Economic Cooperation and Development (OECD) reported that the subjective happiness levels of 15-year old students in Japan ranked 42 out of 47 countries [16]. Subjective happiness levels in adolescents are associated with lifestyle behaviors such as physical activity, eating habits, smoking, and drinking alcohol [17,18], and can also be negatively correlated with problematic Internet usage [19]. It has also numerous positive effects on physical and mental health in adult populations, including improved cardiovascular functioning [20], a stronger immune system [21], an increased survival rate [22], and an appropriate sleep duration [23].

Good sleep quality and fewer sleep problems have been associated with subjective happiness and positive affect in adult populations [24–26]. Pressman and Cohen [21] propose two general models by which responses to stress and positive affect (eg, happiness, joy, excitement, and contentment) can promote health. In the first model, positive affect directly influences overall-health related behavior regardless of its impact on stress responses. In the second model, positive affect may work to reduce negative assessments of distress and, therefore, facilitate adaptive coping [21]. Other studies have further examined the influence of sleep problems on subjective happiness [23,27]. In one study, the relationship between subjective happiness and sleep duration was found to be J-shaped, with women who reported sleeping for an average of 8 h per night also more likely to report being generally happy [22]. Thus, research has suggested that sleep and happiness may be associated through a bidirectional relationship [28,29].

However, previous research has primarily focused on adult populations. There is limited research on the association between subjective happiness and sleep problems in adolescents [14,18]. Moreover, there has been little investigation into possible differential effects of subjective happiness on different sleep problems, and there have been no nationwide studies conducted in Japan investigating their relationship. Therefore, in this study, we used three different sleep problems to examine the relationship between subjective happiness and sleep problems in adolescents. Previous studies have been limited by relatively-small sample sizes and a poor representation of the study population. In order to address these issues, we secured and analyzed a sufficient sample population with high representative quality. Based on the findings in previous research, we hypothesized that adolescents' lower subjective happiness levels would be negatively associated with sleep problems (eg, insomnia, short sleep duration, and poor sleep quality). Each region of the world has its own culture and tradition. However, physiological needs like sleep are important for all adolescents, regardless of culture. The exploration performed in this study of the associations between subjective happiness and sleep problems should result in findings that can be used to inform future research and policy on the importance of subjective happiness as it relates to good sleep hygiene in adolescents in Japan as well as other countries.

2. Methods

2.1. Survey procedure, design, and participants

We previously conducted cross-sectional nationwide surveys of lifestyle habits (eg, alcohol consumption, smoking habits, eating, and sleeping among Japanese adolescents) [4,30,31]. This was the eighth survey of its kind. Of the 10,235 junior and 4907 senior high schools registered in Japan in May 2017, we sampled from 98 junior and 86 senior high schools using a stratified, single-stage cluster-sampling method, which involved dividing Japan into regional blocks and selecting schools from each block at random. This method was used to limit sampling bias. The sample size was determined using the response rates and confidence intervals obtained from a previous study [30]. We sent a letter to the principals of selected schools requesting their cooperation, along with questionnaire forms and envelopes for enrolled students. In cooperating schools, classroom teachers were asked to inform students of the study, including its confidentiality and voluntary participation, and to ensure the protection of privacy. Written informed consent was obtained from all study participants. We used questionnaires devoid of all identifying information to safeguard participants' privacy and anonymity. Teachers delivered the completed questionnaires in sealed envelopes back to our department. We obtained replies from 48 junior high schools (response rate: 49.0%) and 55 senior high schools (response rate: 64.0%; response rate for all schools: 56.0%), for a total of 118,303 enrolled students. A total of 64,417 individuals responded. From those 64,417 responses, we excluded 265 questionnaires that were missing information regarding gender or had inconsistent responses or missing variables. Thus, 64,152 questionnaires were analyzed (effective response rate = 54.4%). The age range was 12–18 years (mean = 15.7 ± 1.7 years).

The survey period was from December 2017 to February 2018. This survey was approved by the Ethics Committee of Tottori University, School of Medicine. Financial support for this study was provided by a health science research grant from the Japanese Ministry of Health, Labor, and Welfare.

2.2. Measures

The questionnaire collected information on the following: (1) personal data, (2) sleep status, (3) subjective happiness, (4) lifestyle behaviors, and (5) mental health status. Personal data included gender, age, school grade, and school type (junior high school or senior high school).

For sleep status, we surveyed insomnia, sleep duration, and subjective sleep quality. To assess for symptoms of insomnia, we asked participants if they had difficulty in initiating sleep (DIS), difficulty in maintaining sleep (DMS), and/or early morning awakening (EMA) in the past 30 days. Participants could indicate "yes" or "no" to whether they experienced these symptoms, and participants who indicated experiencing at least one of the symptoms were considered to experience insomnia. These items are frequently used to assess sleep problems in epidemiologic studies [4,9,31]. Sleep duration was measured by self-report of average hours of sleep per night in the past 30 days, which was categorized into six groups: (1) less than 5 h, (2) 5–6 h, (3) 6–7 h, (4) 7–8 h, (5) 8–9 h, and (6) 9 h or more. We defined "short sleep duration" as a reported average of less than 6 h of sleep per night [31]. For subjective sleep quality, four options were provided: "very good," "good," "bad," and "very bad." Participants who responded with "bad" or "very bad" were considered to have poor sleep quality [31].

Subjective happiness was assessed using a single question: "In general, how would you describe your happiness right now?"

Participants responded using a visual analogue scale. Participants were instructed to: (a) focus on their global estimation and general feelings, (b) take note that 0 is the minimum and 10 is the maximum, and (c) select the number that best described their feelings. This single-item scale has been shown to have good concurrent, convergent, and divergent validity [32], and single-item happiness measures have been used widely throughout the world [33,34]. We categorized this scale into five groups and analyzed the resulting data.

For lifestyle behaviors, we assessed participants for the following: frequency of eating breakfast ("every day," "sometimes," or "seldom"), participation in sports club activities ("participation" or "no participation"), drinking and smoking habits, and Internet usage. For eating breakfast, respondents who selected "daily" in the "yes" category and those who selected "sometimes" or "never" in the "no" category were used for analysis. Participants were considered current smokers and/or drinkers if they indicated they engaged in these activities one day or more per week. To assess Internet usage, we used the 8-item version of the Young Diagnostic Questionnaire for Internet Addiction (YDQ) [35], translated into Japanese [36]. Each item on the YDQ is rated dichotomously ("yes" or "no"), and total scores range from 0 to 8. As in previous studies of adolescents, problematic Internet use was defined as providing affirmative answers to at least 5 YDQ items [37,38]. To evaluate participants' future direction, we used the following question: "What is your plan for your future life course?" Participants selected one of 7 options: "high school," "vocational school," "college," "university," "postgraduate school," "taking a job after leaving the current school," or "not decided yet." Those who selected "university" or "postgraduate school" were grouped as students who intended to go to university; otherwise, participants were grouped as students who did not intend to go to university or those who had not yet decided on their future direction [4].

Mental health status was assessed using the 12-item General Health Questionnaire (GHQ-12) [39]. A GHQ-12 score of 4 or higher has been used in prior studies to indicate poor mental health [40]; however, we used the GHQ-2 due to space limitations on the questionnaire. The GHQ-2 has been indicated to show good sensitivity and specificity (87.0% and 85.1%, respectively) and to provide a cut-off of ≥ 1 [41]. The GHQ-2 provides one item from the depression/anxiety factor (asking whether respondents felt an anxiety and depression in the previous 30 days; response options were "not at all," "no more than usual," "more than usual," and "much more than usual") and one from the decrease in positive feelings factor (asking whether respondents could enjoy normal activities in the previous 30 days; response options were "more so than usual," "same as usual," "less than usual," and "much less than usual").

2.3. Data analysis

First, we identified participants' demographics by gender. Second, we calculated the prevalence and 95% confidence intervals (CI) of each sleep problem by gender using the χ^2 test. Third, we calculated the distribution of subjective happiness scores by gender. Fourth, we calculated the prevalence of each sleep problem in relation to subjective happiness scores. Finally, we conducted univariable and multivariable logistic regression analyses, calculating the adjusted odds ratios (ORs) of subjective happiness and its 95% CI for each sleep problem. The explanatory variables in the multivariable logistic regression analysis included basic demographic characteristics (gender and school grade), lifestyle behaviors (eating breakfast, club participation, drinking habits, smoking habits, Internet usage, and future direction), and mental health status. To determine explanatory variables, we referred to

factors associated with sleep problems in previous studies [17,19,31,35,42–44]. A previous study found a weak correlation between happiness and GHQ [45]; however, multivariate analysis have shown mental health and happiness to have different psychological strains [46]. This finding have suggested that the change of happiness scores is an emotion that appears earlier than depressed mood. In addition, the relationship between sleep and mental health is important [9]. Thus, we added mental health status to the explanatory variables. Participants for whom data were missing were excluded from the analyses. We set the significance level at $p < 0.01$. All analyses were performed using SPSS Statistics 22.0 [47].

3. Results

Table 1 shows the participant demographics by gender. The lowest subjective happiness scores (0–2), were reported by 5.6% of male students and 4.4% of female students. The highest subjective happiness scores (9–10), were reported by 19.5% of male students and by 20.2% of female students. In general, female students tended to report higher subjective happiness scores than male students.

Most male and female students ate breakfast everyday (81.2% and 85.2%, respectively). Almost all male and female students did not smoke or drink (97.5% and 98.9%; 93.8% and 95.3%,

p-value		<0.001	<0.001	<0.001

p-values were calculated by X²-test (gender; male or female) × 2 (each sleep problem; yes or no).

Participants with missing data were excluded from the analysis.

Insomnia: participants who had one or more symptoms of insomnia; SSD: Short sleep duration (<6 h).

respectively). However, 48.1% of male students and 59.2% of female students reported poor mental health, while 12.2% of male students and 17.1% of female students reported problematic Internet use.

Table 2 shows the prevalence of each sleep problem by gender. The prevalence of insomnia symptoms was 19.3% (males: 18.7%, females: 20.1%), short sleep duration (SSD) was 30.1% (males: 28.4%, females: 32.0%), and poor sleep quality was 37.3% (males: 36.3%, females: 38.5%). Gender differences were observed across all sleep problems.

Fig. 1 shows the relationship between each sleep problem and subjective happiness scores. Linear relationships can be observed between sleep problems and subjective happiness scores. Among the lowest subjective happiness group (0–2), the prevalence of insomnia, SSD, and poor sleep quality were 40.0%, 49.5%, and 62.2%, respectively. However, among the highest subjective happiness group (9–10), the prevalence of insomnia, SSD, and poor sleep quality were 13.6%, 23.7%, and 23.7%, respectively.

Table 3 shows the univariate logistic regression analysis for associations between each sleep problem and subjective happiness. Compared to those students who reported the highest levels of subjective happiness, those who reported the lowest levels of subjective happiness displayed 4.25 (95% CI: 3.89–4.64, p < 0.001) times higher ORs for insomnia, 3.14 (95% CI: 2.90–3.41, p < 0.001) times higher ORs for SSD, and 5.29 (95% CI: 4.86–5.75, p < 0.001) times higher ORs for poor sleep quality. Thus, we found that the lower the reported subjective happiness score, the higher the unadjusted ORs for each sleep problem.

Table 4 shows the multivariable logistic regression analysis for associations between each sleep problems and subjective happiness after adjustment for variables related to demographics, lifestyle behaviors, and mental health status. Compared to students who reported the highest subjective happiness scores, those who reported the lowest subjective happiness scores had 2.64 (95% CI: 2.41–2.90, p < 0.001) times higher ORs for insomnia, 3.27 (95% CI: 2.99–3.57, p < 0.001) times higher ORs for SSD, and 2.48 (95% CI: 2.27–2.70) times higher ORs for poor sleep quality. Thus, our findings showed that the lower the reported subjective happiness score, the higher the ORs after adjusting the related factors for each sleep problem.

4. Discussion

The present study is the first nationwide, representative cross-sectional study to examine the association between subjective happiness and sleep problems among Japanese adolescents. Specifically, we found that adolescents who reported lower levels of subjective happiness also reported a higher prevalence of sleep disturbances, including insomnia, SSD, and poor sleep quality, compared to adolescents who reported higher levels of subjective happiness. This association was consistent in the fully adjusted model, which controlled for the variables of demographics, lifestyle behaviors, and mental health status. Linear relationships were

Participants for whom data were missing were excluded from the analyses.

indicated between subjective happiness level and sleep problems. These findings have important implications for public health, as they show the magnitude of the association between subjective happiness and sleep problems.

As hypothesized, lower subjective happiness scores were significantly related to insomnia, SSD, and poor sleep quality. Previous cross-sectional studies showed that lower subjective happiness was associated with a higher risk for sleep problems [24–26,48]. For example, those with insomnia are 3.27 times more likely to describe themselves as being unhappy compared to those who do not have insomnia [48]. In contrast, a cross-sectional study of 750 American adolescents revealed that subjective happiness had a significant correlation with sleep duration, but not with sleep deprivation [49]. With regard to the association between bedtime and feeling unhappy at school, a cross-sectional study of Japanese adolescents found the adjusted odds ratios (AORs) for those with a late bedtime (after midnight) to be 1.45 times that of adolescents with an early bedtime [50]. As SSD is frequently linked to a delay in bedtime [51], these results are similar our findings.

Notably, adjusted ORs for SSD were higher than unadjusted ORs in all subjective happiness variables. The reason for this difference was the confounding factors that influenced the relationship between subjective happiness and SSD [52]. That is, the statistical control of a third variable altered the strength of association between SSD and subjective happiness. Thus, the strength of the relationship between subjective happiness and SSD may be stronger than between subjective happiness and either insomnia or poor sleep quality.

Our results showed further evidence that linear relationships such as the dose-response subjective happiness score are associated with sleep problems. That is, the lower the subjective happiness score, the higher the ORs for sleep problems. This finding was important because subjective happiness has been reported to be associated with adverse health outcomes in areas such as cardiovascular functioning [20], immune system strength [21], survival rate [22], and quality of life [53]. Furthermore, subjective happiness has been widely studied due to its interactive effects on mental

health [54]. For example, higher levels of subjective happiness may serve as a protective factor for depression [55]. As the findings of the present study suggest, subjective happiness is a major public health concern related to the goal of life. Furthermore, awareness among educators and policy makers in Japan on the importance of subjective happiness is low. Therefore, public health interventions to raise awareness of the benefits of increased levels of subjective happiness may play an important role in promoting the improvement of sleep hygiene and other positive physical and mental health outcomes for adolescents.

The causal pathways linking sleep problems with subjective happiness are still not clear. As in the present study, previous studies have cited subjective happiness to be a sleep-related factor [21,25,28]. There are two possible mechanisms by which subjective happiness can promote higher sleep quality [21]. One is that subjective happiness can directly influence overall health-related behavior regardless of its impact on responses to stress. Thus, adolescents with high levels of subjective happiness may be more likely to engage in maintaining good sleep hygiene [28]. The second is that subjective happiness may help to reduce negative feelings and promote better adaptive coping skills. Adolescents with higher levels of subjective happiness may then cope more effectively with stressors. Thus, they may not experience the effects of stress in a way that leads to sleep problems. The strong associations found in our study between subjective happiness levels and sleep problems independent of poor mental health support this second method.

Some studies have further examined the influence of sleep problems on subjective happiness [23,24,27]. In one study, insomnia symptoms were inversely related to subjective happiness, when adjusted for emotional disorders [27]. A longitudinal study conducted with adult females in the UK found a J-shaped relationship between subjective happiness and sleep duration, indicating that subjective happiness decreased along with either shorter or longer sleep duration [23]. These finding suggested that getting adequate sleep was associated with increased subjective happiness. There are some theories to explain the connection between sleep deprivation and subjective happiness. One study

Table 4

Multivariate logistic regression analysis for association between subjective happiness and sleep problems in Japanese adolescents.

Subjective happiness	Insomnia				SSD				Poor sleep quality			
	N	AOR	95% CI	p-value	N	AOR	95% CI	p-value	N	AOR	95% CI	p-value

Abbreviations: AOR = adjusted odds ratio, CI = confidence interval, SSD = short sleep duration (<6 h).

Insomnia: Participants who had one or more symptoms of insomnia (DIS or DMS or EMA).

Participants for whom data were missing were excluded from the analyses.

Adjusted for gender, grade, club activity, problematic Internet use, having breakfast, drinking, smoking, and intending to study at university by multivariate logistic regression.

proposed that sleep deprivation affects positive emotions such as subjective happiness through networks in the brain related to emotion, rapid eye movement (REM) sleep, emotional information processing, and the cognitive-energy model [56]. From the above findings, it can be posited that a bidirectional relationship exists between sleep problems and subjective happiness [28,29,54,56].

However, the relationship between sleep problems and subjective happiness may also be influenced by several confounding factors, such as cultural differences and socioeconomic status (SES). Adolescents in East Asia generally have lower subjective happiness levels and shorter sleep durations compared to adolescents in other parts of the world (eg, Australia and Scandinavia) where adolescents tend to have higher subjective happiness levels and longer sleep durations [16,57]. Moreover, a study of adolescents in Portugal reported SES was modestly associated with subjective happiness [58]. Mezick et al. [59], reported that lower SES was associated with poor sleep quality in American adults. Thus, we consider it a possibility for future research to conduct a high-quality longitudinal study to ascertain the causal relationship between subjective happiness and sleep quality in adolescents.

The present study showed that female students report more depressive symptoms but also tend to report higher subjective happiness levels than male students. Previous studies have reported that females are superior to males in expressing emotions. For example, LaFrance et al. [60], reported that women use emotional expressions more often than men. In subjective emotional experiments involving looking at facial expression stimuli, females were shown to be more strongly rated as expressing pleasant emotions than males [61]. In addition, gender differences in depressive symptoms have been reported, and males are less likely than females to notice depressive symptoms in themselves [62]. These findings suggest that females experience emotions more strongly than males and express them more frequently or richly.

Based on our findings, we propose the following measures for improving happiness among adolescents, by improving their sleep. School teachers, administrators, and parents must consider the status and importance of adolescents' subjective happiness when providing them with education or discipline. Specifically, we believe it would be effective to educate children on cultivating a sense of happiness by conducting classes that consider the mechanism of happiness and the practice of happy life design in school education. For example, such a lecture could include an overview of the scientific evidence showing that happiness improves sleep problems. Further, if educators and parents do not understand happiness, they will not be effective in teaching children, and we therefore consider it important for them to understand happiness.

This study had three main strengths. First, it is a nationwide survey. Thus, the results of this study can be considered as highly representative of adolescents in Japan. Second, the study had a sample population appropriately large enough for us to establish strong results. This also increased credibility by minimizing the impact of potential random errors in self-reporting, especially among adolescents. Third, it has a survey response rate over 50%, which is high for this type of epidemiological study [63].

Some limitations of this study should also be acknowledged. First, because this was a cross-sectional study, we cannot determine the causal relationships between sleep problems and subjective happiness, or how these relationships might change over time. Thus, future studies should use a longitudinal design. Second, we had to adjust for several potential confounding variables. No data were obtained on factors related to participants' SES (eg, family income or parental educational levels) despite some studies reporting an association between sleep problems and SES [59,64]. Thus, future research should include factors related to SES. Third,

due to limited space on the questionnaire, insomnia in this study could not include the entire clinical diagnostic criteria found in the International Classification of Sleep Disorders (ICSD-3) [65]. Therefore, insomnia as presented in this study may have differed from clinical insomnia. Fourth, objective data could not be used for the present evaluation of sleep habits. A previous study reported that self-reported sleep durations were systematically biased by gender and race when compared with those measured objectively using an actigraph [66]. In addition, according to general recommendations, the average sleep duration for adolescents should be around 8–10 h. However, Japanese adolescents are characterized by taking little time for sleep, and many sleep under 6 h on average per night. Therefore, we considered that measurements of this group with high health risks were important, and defined less than 6 h as SSD. Finally, a non-response bias existed, as over 40% schools and students did not participate. This could be due to some schools refusing to participate in the survey at the discretion of the school principals.

In conclusion, this large-scale cross-sectional study of adolescents in Japan showed that low subjective happiness was strongly associated with sleep problems such as insomnia and poor sleep quality. Considering this association, educators and policymakers should promote the importance of subjective happiness and sleep hygiene education for adolescents. Longitudinal research is needed to further identify the mechanism regulating the relationship between subjective happiness and sleep problems.

ABSTRACT

Background: In this study, we aim to estimate the prevalence of heated tobacco product (HTP) smokers 3 years after the launch of HTPs in Japan.

Methods: Our study, performed in February 2018 in Japan, had a cross-sectional population-based design. A total of 4,628 adult participants (2,121 men and 2,507 women) were randomly sampled from all regions of Japan. The response rate was 57.9%. Interviews were conducted by trained investigators who visited participants' homes. A survey on current (past 30 days) and lifetime tobacco use (including e-cigarettes and HTPs), as well as numerous sociodemographic factors, was conducted.

Results: The age-adjusted rates and estimated number of lifetime-HTP smokers were 14.1% (95% confidence interval [CI], 12.5–15.6%; 7.11 million men) and 3.7% (95% CI, 2.9–4.4%; 1.99 million women). The age-adjusted rates for current HTP smokers were 8.3% (95% CI, 7.1–9.6%; 4.21 million men) and 1.9% (95% CI, 1.3–2.4%; 1.02 million women). Multiple variables were found to be associated with a higher prevalence of current HTP use, including being male, aged 20–39 years, a current Internet user, a risky drinker, or a heavy episodic drinker. HTP use was also higher among men with 10 years or more of education, women with 15 years or less of education, and men with middle- or high-level household incomes.

Conclusion: We concluded that HTP use has increased substantially in Japan. However, regulations for HTPs are weaker than those for combustible cigarettes in Japan. Thus, HTPs should be subjected to the same regulations as combustible tobacco products.

Key words: heated tobacco products; heat-not-burn tobacco; tobacco; population-based study; Japan

INTRODUCTION

Heated tobacco products (HTPs) are relatively new, sold by several tobacco companies, and are used with electronic devices that, without combustion, allow smokers to inhale aerosols produced by heated tobacco leaves.^{1–3} Tobacco companies advertise HTPs as being relatively less harmful than other forms of tobacco, yet HTP aerosols contain nicotine and other chemicals,^{4–6} and the potential harm of secondhand exposure to HTPs has been reported.^{7,8} In 2014, the first HTP, IQOS, was created in Japan. By 2018, the IQOS market share of tobacco sales in Japan reached 15.5%.⁹ Thus, it is necessary to understand the present increase in HTP use from a public health perspective by conducting an empirical investigation into potential harmful effects of HTPs. Given their efficient implementation, Internet-based surveys have predominantly been used to provide current estimates of the prevalence of HTP use in three countries.^{8,10,11} However, to the best of our knowledge, no population-based studies on HTP prevalence have yet been reported. The participants sampled in web-based surveys may be potentially

biased in terms of age and high familiarity with information technology, as participants are typically recruited from a voluntary registered pool. Therefore, the current study was conducted to provide a more accurate estimate of HTP users in Japan by utilizing a nationwide population-based survey.

METHODS

Design

In this cross-sectional study, adults were randomly sampled from all regions of Japan. The respondents were visited at home and interviewed by trained investigators.

Participants

Participants were recruited using a stratified, two-stage random sampling approach. The strata were determined by first dividing the survey districts into eleven areas (Hokkaido, Tohoku, Kanto, Hokuriku, Tosan [Yamanashi, Nagano, and Gifu], Tokai, Kinki, Chugoku, Shikoku, Northern Kyushu, and Southern Kyushu) and then into five groups classified by municipality size (large cities,

Address for correspondence. Aya Kinjo, Division of Environmental and Preventive Medicine, Department of Social Medicine, Faculty of Medicine, Tottori University, 86 Nishi-machi, Yonago, Tottori 683-8503, Japan (e-mail: kinjo.aya@tottori-u.ac.jp).

$n = 14$; cities with populations $\geq 300,000$, $\geq 100,000$, $< 100,000$, and smaller towns and villages). The survey districts were selected from each stratum in proportion to the adult (≥ 20 years old) population. Survey data were collected from participants during the years of 2003 ($n = 3,500$), 2008 ($n = 7,500$), 2013 ($n = 7,500$), and 2018 ($n = 8,000$). This study utilized the 2018 survey dataset, as it included questions on HTPs. The datasets from 2003, 2008, and 2013 were utilized to calculate percentages of tobacco users.

Survey procedures and response rates

The 2018 survey was conducted in February and March of that year. A survey request document was sent to the municipal office after the surveying district was randomly selected. Participants were then randomly selected by the investigator from the resident register at the municipal office. To ensure that participants provided informed consent, they were asked whether or not they would participate in the survey and, if they voluntarily agreed, the investigator visited their residence and conducted the interview. The number of participants and response rate were 4,628 and 57.9%, respectively. The details of previous surveys have been reported.¹²

Indicators of tobacco use

The question on general tobacco use was, “Have you smoked any tobacco often or daily within the past 30 days? (Yes/No)”. The following question on HTPs was answered by any current (ie, past 30 days) tobacco user: “Have you ever used heated tobacco products such as iQOS, glo, or Ploom TECH?”. The question regarding e-cigarettes asked: “Have you ever used e-cigarettes such as FLEVO, EMILI, VITAFUL, or VITACIG?”. The answer choices for those two questions were: “never used”, “have used before, but not within the past 30 days”, and “currently use”. These items identified “any tobacco smoker, past 30 days”, “HTP smoker, lifetime”, “HTP smoker past 30 days”, “e-cigarette smoker, lifetime”, and “e-cigarette smoker, past 30 days”. In addition, participants were categorized into four groups: “non-smoker”, “only smokes combustible tobacco”, “HTP smoker or dual smoker”, and “other”.

Socio-demographic, Internet use, and alcohol use indicators

Participants were classified into the following age groups: 20–29 years, 30–39 years, 40–49 years, 50–59 years, 60–69 years, 70–79 years, and 80 years and older. Educational attainment was classified into four categories: ≤ 9 years of education (junior high school level), 10–12 years of education (senior high school level), 13–15 years of education (technical school level or current university students), and ≥ 16 years of education (university and graduate school level). Marital status was classified into three categories: married or living with a partner, bereaved or divorced, and unmarried. Household size was classified into three categories: living alone, two persons, and three persons or more. Working status was classified according to six categories: regular employee, self-employed, non-regular employee, student, housework, and unemployed. There was no housework status classification for men. Household income was classified into three categories: $< 4,000,000$ yen per year, $4,000,000$ – $8,000,000$ yen per year, and $\geq 8,000,000$ yen per year (100 yen = 0.92 dollars as of February 1, 2018). In 2016, the median and average household incomes in Japan were approximately 4,420,000 and

5,602,000 yen, respectively.¹³ Individuals who used the Internet within the past 30 days were defined as current Internet users. Risky drinkers were defined by daily alcohol consumption (≥ 40 g for men or ≥ 20 g for women), which were the levels adopted in the second term of the National Health Promotion Movement of the 21st century (Health Japan 21).¹⁴ Heavy episodic drinking was defined as drinking ≥ 60 g of alcohol on a single occasion within the past 30 days.¹⁵

Statistical analyses

The age-adjusted rates and estimated numbers of HTP users were weighted based on the population of Japan in October 1, 2017. To calculate lower and upper 95% confidence intervals (CIs) regarding any tobacco, HTP, and e-cigarette smokers, the following formula was used: age-adjusted point estimate $\pm 1.96 \times$ standard error of age-adjusted rate. Regarding the proportion of any tobacco, HTP, and e-cigarette users by sociodemographic background, crude rates were used, and 95% CIs were calculated, without adjusting for age. Individuals who did not respond to questions were included in the analysis as non-respondents. Statistical analyses were performed using Microsoft Excel 2016 software for Windows (Microsoft Corp., Redmond, WA, USA).

Ethical considerations

The study protocol was approved by the ethics committee at the Kurihama Medical and Addiction Centre. During the visit for the interview, the investigator obtained informed consent from participants after providing a comprehensive explanation of the purpose of the investigation, its content, and how personal information would be protected. Researchers did not collect any personally identifiable information from the respondents, as it was excluded from the survey data.

RESULTS

A total of 2,121 men and 2,507 women participated in the 2018 nationwide survey. Participant characteristics are shown in Table 1. Almost 70% of participants were current Internet users. The prevalence of any current tobacco use had steadily decreased between 2003 and 2013, but plateaued between 2013 and 2018.

Table 2 shows the estimates of various tobacco product smokers. The age-adjusted rate and estimated number of current HTP smokers in the Japanese population was 5.23 million, with 4.21 million men (8.3%; 95% CI, 7.1–9.6%) and 1.02 million women (1.9%; 95% CI, 1.3–2.4%). The age-adjusted rate of current users of any type of tobacco was 30.8% (95% CI, 28.8–32.8%) among men and 9.4% (95% CI, 8.3–10.5%) among women. Almost one-third of men and one-fifth of women were HTP smokers in the tobacco-user population. The age-adjusted rate of current e-cigarette smokers was 1.6% (95% CI, 1.0–2.2%) among men and 0.5% (95% CI, 0.2–0.7%) among women, and the number of HTP smokers was higher than e-cigarette smokers. The age adjusted rate estimates were calculated for “non-smoker” (men = 69.2%; women = 90.6%), “only smoke combustible tobacco” (men = 22.0%; women = 7.5%), “HTP smoker or dual smoker” (men = 7.2%; women = 1.4%), and “other” (men = 1.7%; women = 0.5%) groups (see Figure 1).

Table 3 shows the crude rate of various types of tobacco smokers among men by sociodemographic factors. The prevalence of HTP smokers was highest among the following groups:

20–49-year-olds, residents of Tosan, individuals with 10 years or more of education, individuals who were not bereaved or divorced, individuals with 4,000,000 yen or more annual household income, current Internet users, risky drinkers, and heavy episodic drinkers.

Table 4 shows the crude rate of various tobacco smoker types among women by sociodemographic factors. The prevalence of HTP smokers was highest in the following groups: 20–39-year-olds, individuals with 15 years or less of education, individuals with a household size of three or more persons, individuals who were employed or self-employed, current Internet users, risky drinkers, and heavy episodic drinkers.

DISCUSSION

This is one of the first reports to estimate the prevalence HTP smokers using a national population-based survey. The current survey indicated that the estimated number of current HTP smokers in Japan was 4.21 million (8.3%) men and 1.02 million (1.9%) women, as of February 2018. The proportion of HTP smokers is more than one-fourth of the total tobacco-user population.

Several web-based studies have reported HTP prevalence. One study from Japan observed that the prevalence of IQOS use increased from 0.4% in 2015 to 10.6% in 2018 among men and from 0.2% in 2015 to 3.1% in 2018 among women.^{8,16} The 2018 follow-up survey was conducted at the same time as the current study. Considering the 2018 web-based survey was limited to IQOS, the current prevalence estimation is lower than that of the previous study. The difference could be explained by the differences in the age range of participants, the characteristics of participants between web-based surveys and face-to-face interviews, and the research design between cohort studies and cross-sectional studies.

The trend of a decline in tobacco use ceased between 2013 and 2018. While it is unclear whether the current plateau is associated with the launch of HTPs, tobacco industry marketing tactics that suggest HTPs are less harmful than traditional tobacco products may attract conscientious individuals concerned with their health.¹⁷ Additionally, HTPs are presented as sophisticated and clean, which may appeal to young individuals with no prior interest in tobacco.^{17,18} Thus, it is quite possible that the prevalence of tobacco use could have declined further if HTPs had not been introduced.

The present findings show that individuals living with three or more persons were more likely to be HTP smokers. This result may also be related to marketing campaigns from tobacco companies, as the harmful effects of tobacco smoke are well known in Japan, and smokers generally smoke outside their homes. As such, individuals concerned with second-hand smoke impacting family members might shift from cigarettes to HTPs. However, the harm incurred by HTPs cannot be ignored, and such forms of advertising by the tobacco industry arguably pose a health risk to users.⁷ The percentage of HTP users is higher among individuals with risky and/or heavy episodic drinking habits. Smoking habits and drinking habits are highly related, which is likely why HTPs are positively correlated with alcohol consumption.¹⁹ We also observed that the percentage of male HTP users was particularly high in Tosan, an area where the rate of combustible tobacco is also particularly high. However, the findings indicated that the highest percentage of female HTP users was in Tokai, the area where HTPs were first launched in Japan.

The current study has several limitations. The primary limitation is the likely bias associated with self-report measures. Biological samples were not provided by participants, and thus it is possible that participants provided inaccurate answers. To reduce response errors as much as possible, concise and easy questions were used. Additionally, the current survey was carried out in person, which may have reduced incorrect answers. The second limitation is that the sample size of each age group was too small to analyze age differences in HTP prevalence. The effect of age was strong among HTP smokers, and an age-stratified analysis should be conducted to examine related background factors. The fourth limitation is the cross-sectional study design, which does not allow for the verification of causal effects of sociodemographic and risk factors. However, the primary purpose of the current study to estimate the total percentage was not affected by this limitation. The methodology in the current study was suitable in terms of collecting highly representative samples.

In conclusion, the current survey indicated that the estimated number of current Japanese HTP smokers was 4.21 million

(8.3%) men and 1.02 million (1.9%) women, as of February 2018. However, the regulations for HTPs in Japan is weaker than those for combustible cigarettes. As such, equivalent regulations should be extended to HTPs.

次の職員の令和2年度厚生労働科学研究費の調査研究における、倫理審査状況及び利益相反等の管理については以下のとおりです。

1. 研究事業名 循環器疾患・糖尿病等生活習慣病対策総合研究事業

2. 研究課題名 喫煙、飲酒等生活習慣の実態把握及び生活習慣の改善に向けた研究

3. 研究者名 (所属部局・職名) 医学部・助教

(氏名・フリガナ) 桑原 祐樹・クワバラ ユウキ

4. 倫理審査の状況

	該当性の有無 有 無	左記で該当がある場合のみ記入 (※1)		
		審査済み	審査した機関	未審査 (※2)
ヒトゲノム・遺伝子解析研究に関する倫理指針	<input type="checkbox"/> ■	<input type="checkbox"/>		<input type="checkbox"/>
遺伝子治療等臨床研究に関する指針	<input type="checkbox"/> ■	<input type="checkbox"/>		<input type="checkbox"/>
人を対象とする医学系研究に関する倫理指針 (※3)	■ <input type="checkbox"/>	■	鳥取大学	<input type="checkbox"/>
厚生労働省の所管する実施機関における動物実験等の実施に関する基本指針	<input type="checkbox"/> ■	<input type="checkbox"/>		<input type="checkbox"/>
その他、該当する倫理指針があれば記入すること (指針の名称:)	<input type="checkbox"/> ■	<input type="checkbox"/>		<input type="checkbox"/>

(※1) 当該研究者が当該研究を実施するに当たり遵守すべき倫理指針に関する倫理委員会の審査が済んでいる場合は、「審査済み」にチェック
クレ一部若しくは全部の審査が完了していない場合は、「未審査」にチェックすること。

その他 (特記事項)

(※2) 未審査に場合は、その理由を記載すること。

(※3) 廃止前の「疫学研究に関する倫理指針」や「臨床研究に関する倫理指針」に準拠する場合は、当該項目に記入すること。

5. 厚生労働分野の研究活動における不正行為への対応について

研究倫理教育の受講状況	受講 ■ 未受講 □
-------------	------------

6. 利益相反の管理

当研究機関におけるCOIの管理に関する規定の策定	有 ■ 無 □ (無の場合はその理由:)
当研究機関におけるCOI委員会設置の有無	有 ■ 無 □ (無の場合は委託先機関:)
当研究に係るCOIについての報告・審査の有無	有 ■ 無 □ (無の場合はその理由:)
当研究に係るCOIについての指導・管理の有無	有 □ 無 ■ (有の場合はその内容:)

(留意事項)
・該当する□にチェックを入れること。
・分担研究者の所属する機関の長も作成すること。
